Open-Cell Spray Foam Expands Opportunities for Renovation Projects

December 19, 2025

LAS VEGAS, NV - December 19, 2025 -
Supreme Spray Foam LV has announced the introduction of open-cell spray foam services in Las Vegas, NV, expanding insulation options for property owners engaged in renovation and improvement projects. The announcement comes as the region prepares for fall, a period when construction and renovation activity often increases before winter weather arrives. With energy efficiency becoming a greater consideration in both residential and commercial building upgrades, open-cell spray foam offers a solution for property owners seeking to improve thermal performance and air sealing during remodelling.

Open-cell spray foam is a lower-density insulation material that expands upon application to fill cavities, gaps, and irregular spaces within building structures. The material provides thermal resistance while also offering sound-dampening qualities, making it suitable for renovation projects where both temperature control and noise reduction are priorities. In Las Vegas, where summer temperatures can be extreme and cooling costs represent a significant portion of annual energy expenses, insulation improvements during renovation work can help reduce long-term operating costs and improve indoor comfort.

Supreme Spray Foam LV in Las Vegas, NV, has been serving the local market with insulation solutions, and the addition of open-cell spray foam provides another material option for clients undertaking building improvements. Renovation projects often offer opportunities to upgrade insulation in hard-to-reach areas, such as walls, ceilings, and attics. By incorporating open-cell spray foam into renovation plans, property owners can address insulation deficiencies that may have existed in the original construction or that have developed over time as materials settle or degrade.

Victor Ramirez, owner of Supreme Spray Foam LV, explained the decision to add open-cell spray foam to the company's service offerings. "Renovation projects give property owners a chance to improve building performance in ways that are not always possible without opening up walls or ceilings. Open-cell spray foam works well in these situations because it can be applied in areas where other insulation types may not fit or

perform as effectively. In Las Vegas, where cooling systems run for much of the year, addressing insulation during renovation can make a real difference in energy use and comfort. We are seeing more property owners who want to take advantage of renovation work to upgrade insulation at the same time," Ramirez said.

The service is available for both residential and commercial renovation projects through a Spray Foam Insulation Company. In residential settings, open-cell spray foam is commonly used during kitchen and bathroom remodels, room additions, and complete home renovations, particularly when walls and ceilings are already exposed. In commercial buildings, a Spray Foam Insulation Company applies the material during tenant improvements, office buildouts, and facility upgrades, especially in areas where sound control between rooms or floors is essential. The lower density of open-cell spray foam allows it to be applied efficiently at high volume, making it useful for projects that require broad coverage.

Fall is considered a practical time for renovation and insulation work in Las Vegas, as temperatures begin to moderate after the intense summer heat. Completing insulation upgrades during this period allows property owners to benefit from improved thermal performance before winter arrives, when heating systems may be used more frequently during cooler evenings and mornings. For commercial property owners, renovation work during the fall can also minimize disruption to business operations compared to peak summer or holiday periods.

Supreme Spray Foam LV has been working with contractors and property owners in the Las Vegas area to incorporate insulation improvements into renovation plans. The company provides assessments of existing insulation conditions and discusses the characteristics of different materials, including the differences between open-cell and closed-cell spray foam. This information helps property owners and contractors decide which insulation type is appropriate for specific applications, based on factors such as space constraints, performance requirements, and budget constraints.

The introduction of open-cell spray foam reflects broader interest in building performance as renovation activity continues throughout the region. As property owners invest in updating and improving buildings, insulation quality is increasingly viewed as an essential component of overall project value. Open-cell spray foam addresses this by providing a flexible insulation solution that adapts to the shape of building cavities and maintains thermal performance over time, contributing to long-term energy savings and comfort.

Renovation projects that include insulation upgrades can also help property owners meet current energy standards and improve building functionality. In Las Vegas, where the climate places high demands on cooling systems, insulation improvements can reduce the energy needed to maintain comfortable indoor

temperatures, thereby reducing monthly utility expenses for both homes and businesses.
