## **A Family Chiropractic Clinic Expands IV Therapy Services to Support Winter Wellness in Denton, Texas**

*December 29, 2025*

Denton, TX - December 29, 2025 -

A Family Chiropractic Clinic announced the expansion of its clinical service offerings to include IV therapy and IV treatments at its Denton, Texas location, responding to increasing patient demand for medically supervised hydration and nutrient support during the winter season. The addition of IV therapies marks a strategic expansion of care designed to complement the clinic's existing treatment approach by addressing seasonal fatigue, dehydration, immune stress, and recovery challenges commonly reported by patients in North Texas during colder months.

A Family Chiropractic Clinic, in Denton, Texas, has provided patient-centered chiropractic and wellness care in the Denton area for years, focusing on conservative, non-surgical approaches to health optimization. The introduction of IV therapy reflects a continued evolution of services as patients increasingly seek integrated solutions that support overall function, recovery, and resilience, particularly during winter when illness rates and energy depletion often increase.

IV therapy, also referred to as intravenous therapy, delivers fluids, vitamins, minerals, and antioxidants directly into the bloodstream. Unlike oral supplementation, IV treatments bypass the digestive system, which

can be especially beneficial for individuals experiencing poor nutrient absorption, dehydration, or heightened physiological stress. At A Family Chiropractic Clinic, IV therapies are administered in a clinical setting under professional supervision, ensuring patient safety, individualized selection, and appropriate dosing.

The winter season in Denton, Texas presents unique health considerations. Fluctuating temperatures, increased exposure to seasonal illnesses, reduced outdoor activity, and changes in hydration habits can contribute to fatigue, brain fog, weakened immunity, and slower recovery from physical or mental stress. Clinic representatives indicated that the timing of the IV therapy expansion was intentional, aligning with patterns observed among patients who report feeling run down or depleted during the colder months of the year.

Among the IV treatments now available is Brainstorm, a blend formulated to support cognitive performance, including memory and mental clarity. This option is intended for individuals experiencing concentration difficulties, mental fatigue, or heightened cognitive demands during the winter months. Another offering, Get Up & Go, is designed to support metabolism and energy levels, addressing complaints of sluggishness and reduced stamina that often accompany shorter days and seasonal disruptions to sleep and routine.

Inner Beauty is also part of the clinic's IV therapy lineup, designed to support skin and hair health. Winter conditions such as dry air, indoor heating, and reduced hydration can impact skin elasticity and hair vitality, making this option particularly relevant during the colder season. Patients seeking support for outward signs of stress and environmental exposure may find this therapy aligned with their wellness goals.

The clinic has also introduced the Myer's Cocktail, a well-known IV treatment composed of a combination of vitamins and minerals traditionally used to support immune function and overall wellness. This IV therapy is commonly selected by individuals dealing with fatigue, allergies, migraines, fibromyalgia symptoms, or recovery from illness. During winter, when immune challenges and seasonal allergies often overlap, the availability of Myer's Cocktail provides an additional option for patients seeking supportive care under professional supervision.

Another IV treatment now offered is Quench, formulated to promote hydration, energy support, and fatigue reduction. Dehydration is frequently underestimated during winter months, as cooler temperatures can reduce thirst signals even while the body continues to lose fluids. Quench is intended to address hydration needs while also supporting energy levels, particularly for individuals balancing work, family responsibilities, and physical recovery during the season.

In addition to these blends, patients at A Family Chiropractic Clinic may choose to add glutathione to their IV therapy. Supplemental glutathione delivered through IV therapy may support patients experiencing elevated stress levels or seeking antioxidant support during winter, when environmental and physiological stressors

can increase.

Dr. Robert Howell, who oversees patient care at the clinic, noted that the expansion into IV therapies was guided by observed patient needs rather than market trends. "Many patients experience cumulative stress during winter, whether from illness, workload, or reduced activity, and IV therapy is often used to support hydration and nutrient balance when the body needs it most," said Dr. Howell. His statement reflects the clinic's emphasis on aligning new services with measurable patient concerns and seasonal health patterns.

The integration of IV treatments into the clinic's service model also allows for coordinated care planning. Patients receiving chiropractic care, physical rehabilitation, or other supportive therapies may incorporate IV therapy as part of a broader wellness strategy, depending on individual needs and clinical assessment. While IV therapy is not positioned as a standalone solution, it offers an additional modality that can support recovery and resilience when used appropriately.

As winter continues in Denton, Texas, clinic representatives anticipate increased interest in IV treatments related to immune support, hydration, and fatigue management. Seasonal illnesses, travel-related stress, and post-holiday recovery are common drivers for patients exploring IV therapy options during this time of year. The clinic's expansion positions it to respond to these needs while maintaining a focus on patient safety and informed care.

A Family Chiropractic Clinic has indicated that patient education will remain a priority as IV therapies are integrated into care plans. Patients are encouraged to discuss their health history, seasonal concerns, and wellness goals with clinical staff to determine whether IV therapy may be appropriate. This emphasis on communication aligns with the clinic's broader approach to conservative, patient-focused care.

Individuals interested in learning more about IV therapy and IV treatments offered at A Family Chiropractic Clinic may visit the clinic's website at <https://chirodenton.com/iv-therapies/> or contact the office directly to schedule a consultation and discuss available options with staff.
