

Fred?s Foundation Repair and Waterproofing Highlights Cost-Conscious Foundation and Basement Solutions

December 29, 2025

ST. LOUIS, MO - December 29, 2025 -
Fred?s Foundation Repair and Waterproofing, a locally owned contractor based in South St. Louis County, is drawing attention to the growing focus many property owners are placing on foundational maintenance and moisture control as repair costs rise across the region.

The company says it has seen more homeowners and small commercial property managers request practical scopes of work and clear, itemized estimates for projects ranging from structural stabilization to basement waterproofing.

Foundation movement and water intrusion are among the most common issues affecting homes in the St. Louis area, particularly in older neighborhoods where shifting soils, seasonal freeze-thaw cycles, and changing drainage patterns can contribute to cracks, settling, and damp basements. While the severity varies from property to property, contractors note that small issues can develop into more disruptive repairs when

left unaddressed, making early evaluation an important step for long-term upkeep.

Fred?s Foundation Repair and Waterproofing provides a range of services that address both structural and moisture-related concerns, including foundation repair, interior and exterior basement waterproofing, crawl space encapsulation, bracing and anchoring, and egress window installation. The company works with property owners to identify the most relevant repairs for the specific structure rather than assuming a universal approach.

?In a lot of cases, people aren?t looking for the biggest possible project; they?re looking for the right fix,? said Fred Keranovic, owner of Fred?s Foundation Repair and Waterproofing. ?We try to start with a careful inspection, explain what we?re seeing, and talk through options so homeowners can make decisions that fit their needs and budget.?

Industry professionals say this kind of decision-making has become more common as households weigh competing expenses and plan repairs over time. Rather than treating foundation and waterproofing work as an all-or-nothing purchase, many homeowners are prioritizing the most urgent issues first, such as active leaks, visible movement, or persistent humidity, then addressing secondary improvements as circumstances allow.

The company attributes its ability to offer cost-conscious project planning to its size and operating structure. As a small business serving the greater St. Louis area, Fred?s Foundation Repair and Waterproofing notes that it can often keep processes streamlined, including scheduling, site assessment, and communication, which can be important for property owners comparing bids and timelines.

?Homeowners deserve straightforward information, especially when they?re dealing with something as stressful as a wet basement or a crack that keeps getting worse,? Keranovic added. ?Our goal is to be clear about what needs attention, what can wait, and what the likely outcomes are for each option.?

Basement waterproofing remains a frequent request, particularly during wetter seasons when sump systems are under heavier use and surface water can expose weaknesses in grading or drainage. Contractors in the region commonly advise that waterproofing plans should account for the cause of the moisture, regardless of whether it?s hydrostatic pressure, poor exterior runoff management, plumbing issues, or gaps in the foundation, since the appropriate solution can differ substantially depending on the conditions.

In addition to water management, foundation stabilization projects often involve assessing whether movement is ongoing and how it is affecting the structure. Bracing and anchoring may be considered when walls show signs of bowing, while crack repairs and reinforcement solutions can be used to address a range of structural concerns. For homeowners planning to finish basements or convert lower levels into living

space, moisture control and structural stability are also important for maintaining safe, usable square footage.
