MoldStar Remediation Sits Down With K L Contractor Plumbing To Discuss Plumbing Leaks and Mold Risks in Marietta

January 08, 2026

MARIETTA, GA - January 08, 2026 -

MoldStar Remediation announced the release of its latest educational blog post, ?How Plumbing Leaks Lead to Mold in Marietta Homes: Q&A with K L Contractor Plumbing Inc? published on the company website. The new article addresses how hidden plumbing leaks can lead to mold growth in residential and commercial properties and explains why early detection and professional remediation play a key role in protecting indoor environments. The blog uses a clear interview format to explain common warning signs, health concerns, and practical steps property owners can take to reduce risk.

The blog focuses on a problem that many property owners overlook. Small leaks behind walls, under sinks, or beneath flooring often go unnoticed for long periods. Moisture from these leaks creates conditions that allow mold to grow. The article explains that mold can spread without visible signs and may affect air quality before residents realize there is an issue. By discussing real scenarios seen in Marietta and surrounding areas, the blog connects local experience with clear guidance that readers can understand and apply.

Alex Laldin, Marketing Director at MoldStar Remediation, explained the purpose of the article and why the company chose this topic. ?We wanted to address plumbing leaks because they are one of the most common sources of mold we see during inspections,? Laldin said. ?Many people think mold only appears after flooding or major water damage, but slow leaks cause just as many problems. This blog gives people clear information so they know what to look for and when to call for help.?

The interview-style blog post outlines how mold often forms in places that homeowners rarely inspect. The content explains how moisture collects behind drywall, inside cabinets, and under appliances. It also describes how mold can remain hidden while still releasing spores into the air. The article stresses that mold growth does not require standing water. Ongoing damp conditions are enough to support growth if the leak continues over time.

The blog also discusses health concerns linked to mold exposure. It explains that mold may cause allergy-like symptoms, breathing discomfort, and other reactions, especially for children, older adults, and people with existing health issues. The article encourages readers to take early signs seriously, including musty odors, staining, or unexplained humidity. By presenting this information in direct language, the blog aims to reduce confusion and help readers make informed decisions.

Laldin emphasized that education is a key part of the company?s mission. ?Our goal is to help people understand how mold starts and how it spreads,? Laldin said. ?If property owners can spot problems earlier, they can limit damage and reduce health risks. This blog reflects what our technicians see every week, and it explains those situations in a way that is easy to follow.?

The article also explains why professional mold inspections are important when plumbing leaks occur. While some leaks are visible, many remain hidden until damage becomes severe. The blog describes how trained professionals use tools to detect moisture and identify mold growth that may not be visible on surfaces. It explains that proper remediation involves more than surface cleaning. The source of moisture must be fixed, and affected materials may need removal or treatment to prevent future growth.

MoldStar Remediation uses the blog to explain the value of proper remediation procedures. The article notes that incomplete cleanup can allow mold to return. It explains that professional remediation follows controlled steps to contain affected areas and reduce the spread of spores. This approach protects both occupants and the rest of the property during the cleanup process.

The blog also highlights how plumbing maintenance plays a role in mold prevention. It encourages property owners to check for leaks, monitor water bills for sudden changes, and address plumbing issues as soon as they appear. The article reinforces that prevention starts with awareness and routine inspection.

According to Laldin, the company plans to continue releasing similar educational content. ?We see education as part of our service,? Laldin said. ?Our blogs allow us to share real information without pressure. People deserve clear answers about mold and water damage, and we will keep providing that through our website.?

MoldStar Remediation serves Marietta and surrounding areas with professional mold inspection, mold removal, and water damage services. The company focuses on clear communication and practical solutions for homeowners, property managers, and business owners. The release of this blog supports the company?s effort to raise awareness about common causes of mold and the steps needed to address them.

The full blog post, ?Plumbing Leaks and Mold Growth in Marietta: An Interview,? is available at the company website. Readers can visit the site to learn more about mold risks linked to plumbing leaks and to access additional educational resources published by the company.
