Paragon Steel Expands Support for Westside Tech and Industrial Projects

January 21, 2026

COMMERCE, CA - January 21, 2026 -
Paragon Steel is expanding support for contractors and fabricators working on Westside projects, aligning steel supply and processing services with the demands of construction in and around Santa Monica, Culver City, and El Segundo. The company is focusing on projects that serve the region?s mix of office, creative, media, light industrial, and logistics facilities, where scheduling and site constraints make reliable material delivery especially important.

Westside projects often combine challenging access with tight construction schedules. Job sites must contend with heavy traffic, limited laydown areas, and strict delivery windows tied to surrounding residential, commercial, and transportation activity. By dedicating additional resources to this part of the Los Angeles market, Paragon Steel aims to help project teams maintain momentum even when work is taking place in dense urban corridors or near major routes to and from Los Angeles International Airport.

The company is working closely with contractors and fabricators to coordinate orders, processing, and deliveries so that steel arrives in line with project phases rather than in large, difficult?to?manage drops. This coordination is particularly important on projects that combine structural work with tenant improvements,

adaptive reuse, or phased renovations, where several scopes must move forward at the same time. Paragon Steel?s goal is to reduce the burden on field teams by ensuring that the right material shows up when and where it is needed.

?Projects on the Westside are often built in tight spaces with limited room for error,? said Jim Stavis, President & CEO of Paragon Steel. ?Our customers need a steel partner that understands these constraints and can help them keep work flowing without overwhelming their sites with material or missing critical windows.?

The company coordinates dedicated delivery routes for fabricators and contractors in Santa Monica, Culver City, and El Segundo, helping projects near the Westside and LAX area stay on schedule despite congestion and limited laydown space. This includes support for work in creative office campuses, studio and media spaces, industrial parks, and logistics facilities that serve both local businesses and regional transportation networks. By planning deliveries around site access, loading conditions, and crew schedules, Paragon Steel helps contractors make the most of each available window.

Paragon Steel offers structural shapes, plate, and miscellaneous metals to support a wide range of Westside project types. The company provides cutting, drilling, and basic fabrication services designed to prepare material for efficient installation, which can be especially helpful on multi?story projects and tight urban sites. This approach is intended to minimize the amount of field work required and reduce disruptions in occupied or partially occupied buildings.

In addition to product and processing capabilities, Paragon Steel emphasizes communication with project managers, superintendents, and shop personnel. The company?s team works to confirm delivery times, truck access routes, and staging constraints in advance so that each shipment can be received and offloaded with minimal disruption. This planning is particularly valuable for projects that share access with neighboring businesses or operate in mixed?use developments where public traffic must be maintained.

Paragon Steel?s expanded focus on the Westside is designed to complement its broader support for the greater Los Angeles area. By tailoring delivery plans and processing services to the specific needs of Santa Monica, Culver City, and El Segundo projects, the company aims to give contractors a steel supply partner that understands the realities of working in this part of the city. Contractors and fabricators planning new construction, expansion, or renovation projects on the Westside can contact Paragon Steel to review upcoming work and discuss scheduling, product options, and processing requirements.
