Goodberlet Home Services Launches Spring HVAC System Tune-Up Programs for Chicagoland Properties

February 11, 2026

KANKAKEE, IL - February 11, 2026 -
Goodberlet Home Services has announced the launch of comprehensive spring HVAC system tune-up programs for residential and commercial properties throughout Illinois and Indiana. The family-owned company, serving customers for over 43 years, has developed preventative maintenance protocols that prepare heating and cooling systems for seasonal transitions while identifying potential problems before they cause system failures or efficiency losses.

The spring HVAC tune-up programs provide property owners with complete system evaluations covering both heating and air conditioning equipment. Licensed HVAC technicians perform multi-point inspections, cleaning procedures, performance testing, and adjustments that optimize system operation. Services address furnaces, air conditioners, heat pumps, thermostats, ductwork, and air quality components to ensure complete system readiness heading into cooling season.

"Spring represents the ideal time for HVAC maintenance as systems transition from heating season to cooling season," said a company representative from Goodberlet Home Services. "Our tune-up programs ensure furnaces receive proper end-of-season service while air conditioners get prepared for summer

demands. This dual-season approach maximizes system reliability and helps homeowners avoid emergency repair situations during temperature extremes."

The launch of structured spring maintenance programs addresses the importance of bi-annual HVAC service that manufacturers recommend for maintaining equipment warranties and achieving expected system lifespans. Regular maintenance prevents minor issues from developing into major failures that require costly repairs or premature system replacement. Spring tune-ups also identify efficiency problems that increase energy costs throughout the cooling season.

Furnace inspections during spring service visits examine heat exchangers for cracks or deterioration that could allow carbon monoxide leakage into living spaces. Technicians test safety controls, verify proper burner operation, and check flue systems for adequate draft. End-of-season furnace service also addresses problems that emerged during the heating season but were not yet prioritized for repair.

Air conditioning system preparations include cleaning evaporator coils that accumulate dust and debris during winter, inspecting refrigerant lines for damage, testing capacitors that commonly fail during initial seasonal startups, and verifying proper refrigerant charge levels. Technicians clean condenser coils on outdoor units, clear away accumulated debris, and confirm adequate airflow through all system components.

Thermostat evaluations confirm accurate temperature sensing, proper communication with HVAC equipment, and correct operation of both heating and cooling modes. Goodberlet Home Services tests thermostat calibration and recommends programmable or smart thermostat upgrades when outdated equipment limits comfort or system efficiency.

Condensate drain system service prevents clogs that cause water damage during cooling season. Technicians clear drain lines, treat drains to prevent algae growth, and test float switches that shut systems down if drains back up. Condensate problems frequently emerge during early cooling season and can go unnoticed until water damage has already occurred.

Electrical connection inspections examine all system wiring, test voltage and amperage levels, tighten terminals that loosen from thermal cycling, and verify proper operation of contactors and relays. Electrical problems are among the most common causes of HVAC system failures, and identifying issues during maintenance visits prevents breakdowns during peak usage periods.

Written service reports document all inspection findings, measurements taken, services performed, and recommendations for additional repairs or upgrades. Reports provide homeowners with complete system status information and help them make informed decisions. Documentation also supports warranty claims and creates maintenance records valuable for future service needs.

Spring tune-up programs include one-year no-breakdown guarantees for systems receiving complete service, providing homeowners with confidence that maintained equipment will operate reliably throughout cooling season. The company also offers enhanced benefits for customers enrolled in Preventative Maintenance Agreement programs and Good Guys Club memberships, including priority scheduling and service discounts.

Goodberlet Home Services serves residential and commercial customers throughout the Chicagoland area from offices in Kankakee, Oakbrook Terrace, and Muncie. Spring HVAC tune-up appointments typically require 60 to 90 minutes for residential systems. The company accommodates customer schedules with flexible appointment times including evening and weekend availability.

Property owners interested in spring HVAC tune-up services can contact Goodberlet Home Services through the company website or by phone. Early scheduling is recommended to secure preferred appointment times before peak cooling season demand arrives.
