

Guardian Pro Roofing And Improvements Expands Roof Replacement Services

February 11, 2026

PITTSTOWN, NJ - February 11, 2026 - PRESSADVANTAGE -

Guardian Pro Roofing And Improvements has announced the completion of a roof replacement project for a residential property in Pittstown, New Jersey, reflecting continued activity in its roofing operations during the current winter construction season. The project involved removal of existing roofing materials and installation of a new roofing system designed to meet current building and weather-resistance standards, supporting the company's ongoing work in residential and commercial roofing services across the region.

"The project reflects our standard process for evaluating existing roof conditions and completing replacements in accordance with manufacturer specifications and local requirements," said Pete Letushko, company representative at Guardian Pro Roofing And Improvements. "Each roof replacement is approached as a standalone construction task, with attention given to materials, installation procedures, and inspection at completion."

The roof replacement in Pittstown followed an initial inspection to assess age-related wear, material

condition, and prior repair history. Based on these findings, the existing roof system was removed and replaced with new materials selected for compatibility with the structure and prevailing climate conditions. Work was scheduled to minimize disruption to the property and was completed within the projected construction timeframe.

Guardian Pro Roofing And Improvements provides roof installation, roof repair, and roof replacement services for residential and commercial properties. The company also performs gutter installation, gutter guard installation, roof inspections, and storm damage roof repair. These services are structured to address common roofing issues such as material deterioration, water intrusion, and weather-related damage, as well as planned upgrades to existing roofing systems.

Roof replacement projects typically involve coordination between inspection, material sourcing, installation, and final review. Guardian Pro Roofing And Improvements reports that inspections are used to document roof conditions and determine whether repair or full replacement is appropriate. Replacement projects are generally recommended when roofing materials have reached the end of their service life or when damage is extensive enough to affect structural performance.

In addition to residential roofing, Guardian Pro Roofing And Improvements undertakes commercial roofing projects that require compliance with different load, drainage, and material specifications. Commercial work may include flat or low-slope roofing systems, scheduled maintenance, and replacement of aging roof assemblies. The company indicates that commercial and residential projects are managed through similar planning and documentation processes, with adjustments based on property type and use.

Gutter installation and gutter guard services are often completed in conjunction with roof replacement projects. These systems are intended to manage water runoff and reduce debris accumulation along roof edges. Guardian Pro Roofing And Improvements notes that gutter work is evaluated as part of the overall roof condition assessment, particularly when existing systems show signs of corrosion, misalignment, or inadequate drainage.

Storm damage roof repair remains an ongoing component of the company's service offerings, especially following severe weather events. These repairs may involve temporary mitigation measures as well as permanent restoration work. Roof inspections conducted after storms are used to document damage and determine appropriate next steps, including repair or replacement when necessary.

Guardian Pro Roofing And Improvements operates from its location at 5 I-78 Frontage Rd, Pittstown, NJ 08867, and can be reached by phone at (856) 386-1514. Roofing materials used in replacement projects vary by application and may include commonly specified residential and commercial products selected based on structural requirements and availability. Installation methods follow published manufacturer guidelines and

applicable codes.
