Board-Certified Surgeons at Clareo Plastic Surgery Offer Botox in Newton

March 09, 2026

CHESTNUT HILL, MA - March 09, 2026 -
Patients who are seeking subtle wrinkle reduction and preventative care have access to Botox® in Newton at Clareo Plastic Surgery, performed by board-certified plastic surgeons and Registered Nurses under their guidance. Treatments at Clareo emphasize a precise, anatomy-focused approach that prioritizes natural movement while reducing dynamic lines in areas such as the forehead, between the eyebrows, and around the eyes.

Botox® is a popular neuromodulator that works by temporarily relaxing targeted facial muscles, helping prevent deep creases from forming while simultaneously softening existing wrinkles. Procedures are minimally invasive, typically lasting 15 to 30 minutes, and require little to no downtime.

At Clareo Plastic Surgery, each patient begins with a detailed facial assessment, which includes evaluation of muscle activity, skin quality, and facial structure. The practice offers multiple FDA-approved neuromodulators ? Dysport®, Daxxify®, and Xeomin® ? so treatments can be tailored based on onset, duration, and muscle response. Care plans account for individual anatomy, movement patterns, and aesthetic goals, ensuring results are harmonious and subtle.

Meanwhile, the practice's male patients receive fully customized plans that take the thicker, more active facial muscles into consideration. Dosing and placement are carefully calibrated to maintain a natural expression, with the aim being to balance functional and aesthetic outcomes. Surgeons and the Nurse Injector at Clareo Plastic Surgery draw on many years of male cosmetic surgery experience to map injections with precision, which enables them to avoid overcorrection while softening tension lines.

Aside from the aesthetic aspect, Botox® also has several established medical uses; some common applications can include chronic migraines, hyperhidrosis, and jaw tension. Patients seeking care for these conditions, among others, can coordinate cosmetic and therapeutic treatments within a single plan, reflecting the treatment?s extensive safety record and clinical history.

Treatments at Clareo Plastic Surgery are cumulative, and most patients will notice results appearing within 5 to 10 days and becoming fully visible by 2 weeks. The effects of Botox® or similar neuromodulators generally last 3 to 4 months and are influenced by muscle activity and metabolism, as well as the area that was treated. For those who are willing to be consistent, regular treatments can reduce the amount of product required over time. Clareo's providers will continually adjust future appointments as facial anatomy and goals evolve, maintaining natural, balanced results.

All injections at Clareo Plastic Surgery are performed by the practice's surgeons, Dr. Michael Tantillo, Dr. Christopher Lee, or Shabeli Villa, BSN, RN, LE, ensuring continuity, anatomical expertise, and precision. This approach avoids rotating injectors and supports cumulative outcomes, enhancing subtle, proportional results over multiple treatments.

Patients from Newton and the surrounding areas will experience a personalized, coordinated approach to aesthetic care that integrates neuromodulators with dermal fillers, microneedling, chemical peels, and surgical procedures when appropriate. Every care plan at Clareo is specifically designed to preserve facial harmony, emphasizing structural awareness and natural movement.

At Clareo Plastic Surgery, the goal is to provide Botox® treatments in Newton that can be personalized for each and every patient, giving them subtle, anatomically informed results that maintain expression while addressing both preventive and corrective goals.

About Clareo:
Clareo specializes in a wide range of cosmetic procedures tailored to enhance natural beauty. From subtle refinements to comprehensive transformations, the practice focuses on patient-specific results that support

confidence, wellness, and long-term satisfaction.
