

Smith Machine Home Gym With Cable Weights Available for Pre-Order by Strongway Gym Supplies

March 11, 2026

Coventry, UK - March 11, 2026 - PRESSADVANTAGE -

Strongway Gym Supplies has opened pre-orders for Smith machine home gyms with integrated cable weight systems. The equipment combines guided barbell tracks with multi-station cable attachments, now accessible through the company's online platform across the United Kingdom.

Smith machines feature vertical or near-vertical bar paths fixed along steel rails. The guided movement removes the need to stabilise the bar during squats, presses, and rows, which changes how these exercises feel compared to working with free-weight barbells. Hook points sit at regular intervals along the rails, letting users lock the bar at any height by twisting the wrists during a set.

Counterbalance systems bring the starting weight of the bar down from the standard 20 kilograms found on Olympic bars to roughly 10 or 15 kilograms. This lighter starting point suits users building initial strength or working through rehabilitation where full barbell loads might strain recovering joints or muscles. Plates load onto the bar ends to increase resistance as needed.

Cable stations integrated into the frame expand what can be done beyond the Smith bar alone. High pulleys handle lat pulldowns and cable crossovers, whilst low positions accommodate seated rows and upright rows. These attachments consolidate multiple exercise types into one footprint rather than requiring separate machines scattered across a garage or spare room.

Mandip Walia, Co-Director at Strongway Gym Supplies, said Smith machines suit people who train alone at home without spotters. "The fixed bar path takes away some of the balance work, but it also means there's less risk if someone reaches failure on a heavy set," he noted. "The hooks are right there. Twist and the bar locks. That becomes important when the nearest help might be in another room or unavailable entirely. Research shows that home-based training effectively improves muscle strength, endurance, and power when maintained regularly, and training more than three times weekly produces significantly better results. Having equipment that supports safe solo training makes maintaining that frequency far more practical."

Frame construction uses heavy-gauge steel with powder-coated finishes. Base footprints typically measure around 180 centimetres in length and 140 centimetres in width, though cable station extensions can push this wider depending on the specific model. Height clearance sits near 210 centimetres, fitting most UK homes but potentially tight in older properties with lower ceilings.

In-depth details about the Smith machine can be viewed at: <https://strongway.co.uk/products/strongway-multi-gym-with-weights-multifunction-home-gym-machine-1>.

During lifts, the Smith bar moves a little, which lets the wrists find their natural positions. Linear bearings or bushings help the bar move along its path with very little friction. Some models tilt the bar a few degrees off vertical, which changes how the body works during squats and presses compared to a track that is completely vertical.

Bench press stations slide under the Smith bar with adjustable angles for flat, incline, and decline work. The bench typically moves out of the way when standing exercises take over, freeing space for squats or overhead pressing. Weight plate storage pegs extend from the frame, keeping plates accessible whilst adding mass that stabilises the overall structure.

Pulleys that are routed behind the main frame are used to operate cable attachment points. Instead of pin-selected weight increments, resistance is caused by weight plates loaded onto the cable stack. Although this plate-loaded method requires manual weight changes between exercises, it is less expensive than conventional selectorised systems.

Randeep Walia, Co-Director at Strongway Gym Supplies, remarked that home exercise equipment paired with proper nutrition produces tangible health outcomes. "When combined with a controlled diet, home training can produce meaningful improvements in body composition, blood pressure, and cardiovascular fitness," he explained. "Results comparable to traditional gym-based programmes are achievable at home. The Smith machine provides the structure and safety features needed to train consistently without supervision. That consistency, combined with attention to nutrition, is what drives the actual improvements people are looking for rather than just going through the motions."

Delivery covers mainland UK addresses with the machines shipping in multiple packages due to component size and weight. Assembly requires basic tools and usually takes a few hours with two people managing the heavier frame sections. Instructions walk through the setup process step by step.

The full product range can be explored at: <https://strongway.co.uk/>.

The pre-order announcement follows patterns in the UK home fitness market where demand for comprehensive training systems continues among consumers establishing dedicated workout spaces. Smith machines appeal to users wanting barbell training benefits with reduced injury risk, particularly those working without supervision or with limited lifting experience.
