Lumina Solar Expands Program to Lease Solar Panels

March 16, 2026

HALETHORPE, MD - March 16, 2026 -
Lumina Solar has announced the expansion of its residential solar leasing program, giving homeowners across Maryland a new path to address rising electricity costs through a solar lease that requires no upfront equipment purchase.

The expanded program allows homeowners to lease solar panels installed on their roof by Lumina Solar, rather than purchasing a full solar system outright. Under the solar energy lease structure, the company retains ownership of the solar array and handles all aspects of the solar installation lease, including permitting, equipment, and ongoing monitoring. Homeowners make a fixed monthly payment in exchange for the electricity generated by the solar panels on their property.

According to the U.S. Department of Energy, solar leasing lets homeowners host a solar energy system and purchase the electricity it generates, often at a rate lower than standard utility pricing. Research from the National Renewable Energy Laboratory has found that leasing solar panels removes the barrier of an initial investment that can reach $10,000 to $20,000, making renewable energy panels accessible to a broader range of homeowners. Unlike loans from lenders or other financing arrangements that require credit approval, a solar panel leasing structure through Lumina Solar is designed to offer predictable monthly payments without the long-term debt associated with traditional solar loans.

The Lumina Solar lease structure includes a warranty covering inverters, the solar panel system, and battery storage components for the duration of the contract. Additional warranties cover PV module performance and related solar equipment over the lifetime of the lease. The company coordinates directly with the local utility to manage grid interconnection and renewable energy lease documentation. Lumina Solar also handles all permitting and inspections, providing a defined process that includes consultation, system design, installation, and activation.

Residential solar leasing has grown steadily as electricity costs have continued to rise, and government incentives and rebates for solar energy have made both leased and owned solar systems more common nationwide. For homeowners who prefer not to use cash or take out a loan to purchase a solar power system outright, panel leasing through a company like Lumina Solar provides an alternative energy option with predictable payments. Industry data indicates that solar leases and solar power leases now represent a significant share of new residential installations, offering homeowners credit toward reduced electricity expenses through energy generated on their property.

Lumina Solar currently serves homeowners throughout Maryland and offers solar lease options for both residential solar lease and commercial solar lease applications. The company installs solar power panels from established manufacturers and offers battery storage as part of its leasing solar energy packages. Homeowners interested in exploring a photovoltaic lease or leasing solar panels through Lumina Solar can visit Lumina Solar to learn more about the expanded program. Additional information about Lumina Solar's solar equipment lease offerings is available through the company's solar panel lease page.

The expanded leasing program is available to homeowners across Maryland who are evaluating whether a solar lease fits their energy needs. Lumina Solar expects to complete additional installations throughout the region over the coming months as demand for residential and commercial solar lease options continues to grow. Homeowners interested in the solar panel leasing program can visit Lumina Solar or call (800) 971-6118 for more information.
