# TruSeal America Announces Commercial Sealcoating Services

*March 31, 2026*

INVER GROVE HEIGHTS, MN - March 31, 2026 -
TruSeal America has announced its commercial sealcoating services as part of the pavement maintenance options available for commercial properties. The company applies protective coatings to asphalt surfaces to help manage the effects of use and environmental conditions. These applications form part of a broader strategy for pavement care in business settings.

Commercial sealcoating helps protect asphalt by creating a surface layer that prevents moisture from entering and slows material breakdown. The coating helps maintain the pavement's flexibility and strength over time. This maintenance step is particularly suited to areas subject to frequent vehicle movement and parking activity.

The service connects with the company's other commercial offerings in a coordinated manner. Asphalt paving establishes the initial structure for surfaces that must endure substantial loads. Proven methods and quality materials go into these paving installations to create a solid base. Concrete paving delivers firm surfaces for walkways, aprons, and loading zones where durability under repeated use is necessary.

Snow removal services address seasonal accumulation to keep pathways and lots functional and safe. Striping provides the necessary markings that support organized movement and adherence to safety guidelines in commercial spaces. Together, these elements allow TruSeal America to address multiple aspects of property maintenance, including commercial sealcoating.

Pete Tjornhom, President of TruSeal America, said, "Commercial sealcoating is applied as a measure to support the condition of asphalt in commercial applications. Our process draws from established practices to deliver consistent coverage."

Operations at the company occur through a fully in-house team. Specialized training ensures that personnel are prepared for the technical requirements of commercial projects. This setup provides the ability to control schedules and maintain standards from start to completion of each assignment.

Tjornhom also noted, "Internal handling of all tasks, including commercial sealcoating, enables TruSeal America to respond to client timelines effectively. Coordination occurs directly within the organization for smoother project flow."

The company was established in 2000 and operates under family ownership. This structure has shaped its development of expertise in asphalt work, concrete construction, and sealcoating applications. The range of services covers needs for homeowners' associations, multi-family properties, and commercial operations.

Each project begins with an assessment of the site conditions and client objectives. Plans are developed to fit within available resources while targeting effective outcomes. Material selections take into account performance characteristics suitable for the intended application.

Commercial properties often require ongoing attention due to the intensity of daily operations. Programs that incorporate commercial sealcoating at regular intervals can help extend intervals between more extensive repairs. The company arranges these maintenance activities to align with business activity patterns.

Open lines of communication are maintained with representatives throughout the engagement. Input from the property side helps refine the execution details. The focus stays on achieving results that fulfill the defined project parameters.

Family ownership at TruSeal America brings a foundation of accountability to all client interactions. This element influences the priority placed on relationship building and consistent service quality. Commercial clients engage with the company for solutions that address their specific pavement-related challenges.

Paving services set the stage for long-term performance. When followed by appropriate maintenance steps,

such as commercial sealcoating, the surfaces gain additional resilience. The layered approach supports the management of pavement assets across their service life.

Concrete features receive parallel consideration in site plans. Compatibility between different surface types ensures cohesive functionality across the property. Striping and snow removal round out the support for year-round usability.

The accumulated experience of the organization informs current service delivery. Attention remains fixed on the execution of each element to standard levels. Clients receive outcomes that reflect the company's established methods in commercial sealcoating and related areas.

TruSeal America continues to refine its practices based on operational experience. The emphasis on in-house capabilities and trained personnel supports the delivery of integrated services. Commercial properties gain from this comprehensive capability in pavement management.
