

As Decision Fatigue Disrupts Leadership Performance, Dr. Andrea Adams-Miller Advances One-Day Recalibration Approach

April 07, 2026

Las Vegas, NV - April 07, 2026 - PRESSADVANTAGE -

As organizations operate under accelerating timelines, increasing complexity, and sustained cognitive demand, a growing body of research and media coverage is pointing to a rising leadership risk: the degradation of decision quality under pressure. In response to these conditions, Dr. Andrea Adams-Miller, Executive Advisor at The RED Carpet Connection, LLC, has introduced a rapid decision recalibration intervention delivered in a single day, designed to restore clarity and performance in high-stakes environments.

Across industries, leaders are being required to make high-impact decisions with reduced time, increased scrutiny, and constant information flow. Research from McKinsey & Company indicates that decision-making effectiveness declines as urgency and complexity increase, while Deloitte findings show that executives under prolonged pressure experience reduced clarity, slower response times, and increased reactivity?factors that affect execution, alignment, and strategic outcomes.

The impact of decision fatigue has been widely documented and reported in major media. Coverage in The New York Times and The Guardian has highlighted how decision quality can decline over the course of a day, influencing outcomes in fields such as law and medicine. In leadership contexts, Harvard Business Review has reported that sustained cognitive demand and "always-on" environments contribute to reduced clarity, slower decisions, and increased mental fatigue among executives. An analysis in the MIT Sloan Management Review has further emphasized the need for structured decision systems to reduce bias and improve consistency at scale.

Large organizations have begun responding by formalizing decision-making frameworks to improve consistency under pressure. For example, Google has documented structured, data-informed decision processes designed to reduce cognitive bias and improve reliability in high-volume decision environments, reflecting a broader shift toward optimizing how decisions are made.

Recent research in cognitive science and decision-making has reinforced that performance declines under sustained mental demand. Studies on decision fatigue show that repeated decision-making can impair judgment and increase the likelihood of suboptimal choices, particularly in complex environments (Vohs et al., 2014; Pignatiello et al., 2020). Cognitive load research further confirms that mental processing capacity is limited and degrades under continuous information pressure, increasing susceptibility to bias and reduced decision quality (Paas & Ayres, 2014). In high-pressure conditions, stress has been shown to shift decision-making toward faster, less deliberate processing, often at the expense of accuracy (Starcke & Brand, 2016).

As Daniel Kahneman, Nobel laureate in economics, has demonstrated through decades of research, individuals under pressure tend to rely more heavily on fast, intuitive thinking, which can introduce systematic bias into decision-making.

In response, a growing number of performance strategists are shifting away from long-term development models toward condensed, high-intensity interventions aimed at producing immediate operational impact. These approaches focus on identifying and interrupting mental patterns that disrupt clarity at critical moments, rather than relying on incremental improvement over time.

Within this model, the work is structured as a focused, immersive engagement rather than a traditional advisory format. Leaders are guided through a process that isolates where breakdowns occur in decision-making, communication, and emotional response under pressure. Real scenarios—such as a senior executive managing a time-sensitive acquisition or navigating a high-stakes negotiation—are examined in real time to identify patterns that may not be visible in slower, reflective settings.

Dr. Andrea Adams-Miller works with clients through a dedicated, full-day engagement?conducted either in person or virtually?designed to facilitate focused analysis and real-time recalibration of decision-making, communication, and performance under pressure.

From there, adjustments are applied directly to those moments. This may include refining how information is processed, how responses are formed under pressure, and how communication is delivered when the stakes are high. The emphasis is on observing and adjusting cognitive and behavioral patterns in real time, rather than discussing them conceptually.

Across leadership environments, similar patterns are emerging: high performers maintaining external success while experiencing internal cognitive friction at critical decision points.

?The constraint is rarely access to strategy,? Dr. Adams-Miller said. ?More often, it is internal interference at the exact moment a decision needs to be made?when timing, clarity, and response carry meaningful consequences.?

The shift toward rapid intervention is also prompting discussion within leadership development circles. Traditional coaching models emphasize long-term behavioral change and gradual skill development, while condensed approaches prioritize immediate recalibration. Some experts question whether accelerated interventions can deliver sustained results, while others point to the growing impact of delayed clarity in high-stakes environments.

?In these environments, the cost of hesitation is measurable,? said Dia Adams in CDO Magazine (Nov. 11, 2025), noting that decision speed and clarity are increasingly tied to organizational effectiveness and competitive positioning.

Despite extensive research documenting the decline in decision quality under pressure, relatively few models focus on immediate recalibration of performance in real time.

Dr. Andrea's work, conducted through The RED Carpet Connection, reflects a broader shift toward integrating neuroscience into leadership performance strategy. As organizations continue to operate in environments defined by speed, visibility, and complexity, internal cognitive alignment is increasingly viewed as a prerequisite for effective execution.

This growing body of research and media coverage reflects a broader recognition that decision-making itself?not just strategy?is becoming a critical performance variable in modern leadership.

As pressure on leaders continues to intensify, the demand for faster, more precise decision-making is driving

a reevaluation of how performance is developed, measured, and sustained. Rapid decision recalibration represents an emerging approach within this shift, particularly in environments where timing, perception, and execution directly influence outcomes.

About Dr. Andrea Adams-Miller

Dr. Andrea Adams-Miller is a neuroscience-based executive advisor specializing in authority positioning, strategic influence, and high-stakes communication. She works with executives, athletes, and public figures to improve decision-making, clarity, and performance in complex environments. With more than three decades of experience across business strategy, behavioral science, and media, she integrates neuroscience-informed methodologies to support leaders operating under pressure.

About The RED Carpet Connection, LLC

The RED Carpet Connection, LLC provides executive advisory services focused on strategic influence, authority positioning, and neuroscience-informed performance. The firm supports leaders, entrepreneurs, and public figures in navigating high-visibility environments where communication, timing, and perception directly impact execution and long-term legacy.
