

## **SPL Audit Expands IT Audit Expertise Across Cyprus to Support Organisations Facing Rising Digital Assurance Demands**

*April 14, 2026*

NICOSIA, CY - April 14, 2026 - PRESSADVANTAGE -

SPL Audit has announced the expansion of its specialized IT audit services across additional business centers in Cyprus, responding to growing demand from organizations seeking structured assurance over digital systems, cybersecurity controls, and regulatory compliance in an increasingly technology-dependent environment. The development reflects the firm's continued investment in information systems assurance capabilities and its role in supporting companies navigating complex operational risks associated with digital transformation.

The announcement follows a sustained increase in requests from enterprises operating in regulated and technology-driven sectors that require independent evaluation of their IT infrastructure, governance frameworks, and internal control environments. Businesses across Cyprus are facing heightened expectations from regulators, investors, and stakeholders regarding transparency in digital operations, making formal IT audit processes an increasingly important component of corporate oversight.

SPL Audit confirmed that its expanded service availability will support organizations in additional locations

across Cyprus, enabling a broader range of companies to access structured IT assurance engagements designed to assess the reliability, security, and effectiveness of information systems supporting financial reporting, operational continuity, and compliance obligations.

The extension of these services comes at a time when organizations are accelerating digital adoption across finance, customer management, and enterprise resource planning platforms. As reliance on interconnected systems increases, the need for independent evaluation of IT controls has become central to risk management strategies. Many businesses are now incorporating IT audit functions into wider governance structures to strengthen accountability and maintain confidence among external stakeholders.

According to the spokesperson for SPL Audit, the firm has observed a measurable shift in how organizations approach assurance over digital environments. Organizations across Cyprus are recognizing that information systems are no longer peripheral to governance frameworks but form part of the core infrastructure supporting financial integrity and operational resilience. Expanding access to structured IT audit services allows companies in additional regions to benefit from independent assessments that strengthen transparency and support regulatory alignment.?

The expanded availability of IT audit services is expected to support organizations operating in sectors such as financial services, professional services, shipping, technology, and investment management, where digital platforms play a central role in day-to-day operations. Independent assessments of access controls, system change procedures, data integrity safeguards, and cybersecurity monitoring frameworks are increasingly being incorporated into assurance programs designed to support both compliance and operational effectiveness.

Across Cyprus, regulatory expectations relating to data protection, financial reporting reliability, and operational continuity have continued to evolve alongside the growth of digital business models. Companies are responding by strengthening oversight mechanisms that ensure technology environments operate consistently with internal policies and external obligations. IT audit engagements provide a structured framework for evaluating these mechanisms and identifying areas requiring enhancement or clarification.

The spokesperson noted that organizations are also seeking assurance ahead of external financial audits, acquisitions, or restructuring processes that require greater transparency over technology-dependent controls. ?Independent evaluation of IT environments supports organizations preparing for external review processes by ensuring that system-level controls align with recognized assurance standards. This contributes to stronger confidence among investors, partners, and regulatory authorities.?

In recent years, digital transformation initiatives across Cyprus have accelerated the integration of cloud-based platforms, remote access systems, and automated reporting environments. While these

technologies support efficiency and scalability, they also introduce additional oversight requirements. IT audit services are increasingly being used to evaluate how these systems operate within governance frameworks designed to protect data integrity and maintain business continuity.

The expansion of SPL Audit's services reflects broader developments across the professional services sector, where assurance providers are responding to the growing complexity of technology environments supporting corporate operations. Organizations are increasingly seeking independent confirmation that internal controls remain effective as digital infrastructures evolve, particularly where financial reporting processes rely on automated workflows and interconnected applications.

Companies undergoing international expansion or engaging with cross-border partners are also placing greater emphasis on documented assurance procedures covering information systems. Demonstrating the reliability of technology environments has become an important factor in maintaining credibility with stakeholders operating in multiple jurisdictions. IT audit engagements support these objectives by providing structured evaluations aligned with recognized professional frameworks.

The spokesperson stated that the firm's approach to IT audit engagements is designed to integrate with broader assurance programs already in place within organizations. Structured evaluation of technology environments complements existing internal control frameworks and supports organizations in maintaining consistent oversight as operational complexity increases. Expanding access to these services ensures that businesses in additional regions of Cyprus can obtain the assurance required to support sustainable digital operations.

The announcement also reflects continued collaboration between assurance providers and organizations seeking to strengthen governance structures in response to changing regulatory expectations. As businesses continue to digitize processes relating to financial reporting, customer data management, and operational monitoring, independent evaluation of information systems is becoming an integral element of risk management strategies.

Industry observers have noted that the integration of IT audit procedures into mainstream assurance practices is expected to continue expanding across Cyprus as companies adapt to evolving compliance requirements and stakeholder expectations. The availability of specialized expertise within the local professional services environment supports organizations seeking to address these developments proactively.

SPL Audit indicated that the extension of its IT audit services across additional regions represents part of a wider strategy to strengthen access to technology assurance capabilities throughout Cyprus. The initiative is intended to support organizations at different stages of digital maturity, from companies implementing new

enterprise systems to those seeking formal evaluation of established control frameworks.

The spokesperson added that strengthening confidence in digital governance structures remains a priority for organizations operating in an increasingly interconnected business environment. Independent IT audit procedures provide organizations with a structured foundation for evaluating how technology supports operational objectives while maintaining compliance with evolving expectations. Expanding the availability of these services across Cyprus reflects the importance of accessible assurance expertise in supporting resilient business operations.?

The expanded service availability is expected to contribute to the continued development of structured assurance practices across Cyprus as organizations seek to align technology oversight with recognized governance standards. By extending access to IT audit expertise in additional locations, SPL Audit is supporting businesses across the island in addressing the growing importance of independent evaluation within modern digital operating environments.
