

STAPLERMAXX Expands Electric Telescopic Handler Range for Switzerland Construction Sector

May 19, 2026

OFTRINGEN, CH - May 19, 2026 -
STAPLERMAXX has expanded its telescopic handler range to meet growing demand from Swiss construction and industrial sectors seeking versatile material handling solutions. The expanded product line includes electric and hybrid models alongside traditional diesel units, providing construction companies and industrial operations with equipment options that balance performance requirements with environmental considerations.

According to STAPLERMAXX, the new range addresses specific challenges faced by Swiss construction companies operating in densely populated areas where noise and emissions restrictions apply. The electric and hybrid models in the expanded lineup enable contractors to maintain productivity while complying with environmental regulations that are becoming standard across Swiss municipalities.

The expansion comes as Swiss construction sites increasingly require equipment that can handle diverse tasks while meeting stricter emissions standards in urban areas. Telescopic handlers, which combine the

lifting capabilities of a crane with the versatility of a forklift, have become essential for construction projects where space constraints and material handling flexibility are critical factors.

The company explains that Swiss construction companies are seeking equipment solutions that deliver both operational efficiency and environmental responsibility. Their expanded telescopic handler range aims to provide options for every application, from compact electric units for indoor warehouse construction to heavy-duty models for major infrastructure projects. The ability to offer electric alternatives alongside traditional diesel equipment allows contractors to select the most appropriate solution for each specific project requirement.

The STAPLERMAXX team has structured the expanded range to include models with lifting capacities from 2.5 to 4.5 tons and maximum lifting heights ranging from 6 to 18 meters. Each unit undergoes Swisslifter-certified safety inspections before delivery, ensuring compliance with SUVA safety standards required on Swiss construction sites. The company maintains its complete inventory at its 6,000 square meter facility in Oftringen, enabling immediate availability for both purchase and rental options.

Beyond equipment provision, STAPLERMAXX forklift experts provide comprehensive support services, including operator training, maintenance programs, and spare parts supply. The company's workshop facilities and mobile service vehicles ensure minimal downtime for construction operations, relying on telescopic handlers for critical lifting tasks. This full-service approach has become particularly valuable as construction companies manage multiple projects with varying equipment requirements.

The rental option for telescopic handlers has proven especially attractive for construction companies managing seasonal workload variations or specific project requirements. Short-term rentals allow contractors to access specialized equipment for unique applications without the capital investment of permanent fleet expansion. Long-term rental agreements provide flexibility for extended projects while maintaining predictable operational costs.

STAPLERMAXX specializes in lifting and conveying technology solutions for Swiss businesses across construction, logistics, and manufacturing sectors. As a member of the Swiss Hubstapler Verband Swisslifter, the company maintains partnerships with leading manufacturers, including HANGCHA FORKLIFTS, while operating from its central facility in Oftringen. The company provides sales, rental, and service solutions for material handling equipment throughout Switzerland, supporting businesses with certified safety inspections, comprehensive spare parts inventory, and environmental sustainability programs, including battery recycling services.
