

SERVPRO of Allendale and Greater Holland Addresses Industry Focus on Response Time in Property Restoration

April 27, 2026

GRAND HAVEN, MI - April 27, 2026 - PRESSADVANTAGE -

The property restoration industry continues to place greater emphasis on response time as a critical factor in determining outcomes following damage events. Professionals across the sector recognize that the interval between the occurrence of damage and the initiation of mitigation measures can substantially influence the extent of impact and the subsequent recovery process.

Property damage typically unfolds in distinct phases when not addressed promptly. The immediate phase involves the initial effects of the incident, such as water saturating building materials or fire residues settling on surfaces and contents. Without intervention, secondary damage commonly develops as conditions evolve. For example, sustained moisture can lead to mold growth within 24 to 72 hours, while fire and smoke residues may embed more deeply into porous substances over time.

Prolonged exposure then contributes to long-term structural or material deterioration, including weakened framing, warped flooring, or compromised insulation. These progressions often expand the overall scope of restoration efforts, requiring additional steps to stabilize and repair the affected property.

Joshua A. Ingersoll, Owner of SERVPRO of Allendale and Greater Holland, said, "Operational experience with various damage scenarios shows that the first hours after an event are essential for containing progression and supporting more effective mitigation outcomes."

SERVPRO of Allendale and Greater Holland operates within this time-sensitive context of property damage management. The company maintains 24-hour availability for service deployment, drawing on technicians who hold certifications through IICRC industry standards and complete ongoing training at corporate facilities. This setup supports the application of standardized assessment, extraction, drying, and cleaning procedures designed to address damage at its earliest stages.

The structured methodology aligns with principles of emergency response in property restoration, where coordinated actions help limit escalation from the initial event. In water-related cases, for instance, rapid removal of standing liquid and controlled drying reduce the potential for microbial activity. Similarly, in fire incidents, prompt residue removal and odor neutralization prevent deeper penetration into materials and surrounding areas.

Dean M. Dingman, Owner of SERVPRO of Allendale and Greater Holland, noted, "Delays in the response phase frequently result in greater complexity during restoration, as secondary effects necessitate expanded technical interventions to restore pre-damage conditions."

Eric D. Chesser, Owner of SERVPRO of Allendale and Greater Holland, added, "Consistent application of established processes from the outset allows restoration teams to manage the technical relationship between timing and material stability across residential and commercial properties."

SERVPRO of Allendale and Greater Holland utilizes equipment and techniques drawn from national resources while maintaining local operational capabilities. The company specializes in cleanup and restoration following fire, smoke, or water damage events and provides mold mitigation services for affected structures. Technicians follow documented protocols that prioritize containment, removal of contaminants, and verification of results through industry-accepted methods.

This process-driven framework reflects broader industry practices that treat response time as integral to minimizing the transition from primary to secondary and long-term damage phases. By focusing on prompt deployment and methodical execution, providers like SERVPRO of Allendale and Greater Holland contribute to the sector's ongoing efforts to improve restoration effectiveness based on timing considerations.

SERVPRO of Allendale and Greater Holland is a locally owned and operated franchise that provides cleanup and restoration services for residential and commercial properties. The company, owned by Joshua A.

Ingersoll, Dean M. Dingman, and Eric D. Chesser, specializes in addressing fire, smoke, water damage, and mold mitigation. It forms part of the SERVPRO network, which has delivered restoration services since 1967 and maintains IICRC-certified operations through comprehensive technician training and standardized procedures.
