

Douglas County Tree Service Publishes Guide on Tree Failure Warning Signs

May 22, 2026

May 22, 2026 -
Douglas County Tree Service has published a new homeowner guide that outlines common warning signs a tree may be at risk of falling on a property. The guide was released on the company?s website as seasonal safety information for residents dealing with aging trees, storm exposure, visible damage, and limbs positioned near homes or driveways.

The new resource frames tree failure as a practical property risk rather than a narrow tree care topic. It explains that signs of decline or instability can appear before a tree falls and that early attention may help property owners respond before damage reaches roofs, vehicles, fences, or access areas.

?People often notice that something looks off with a tree but are not sure which signs matter most,? said Alex Laldin, Marketing Director at Douglas County Tree Service. ?This guide was published to explain the warning signals in plain language and give property owners a clearer sense of when a tree may need closer review.?

According to the article, one major sign is a tree that begins to lean more than it did before. The guide treats a new or worsening lean as more serious than a long-standing growth pattern, especially if the tree is shifting toward a house, driveway, or other structure. It presents visible movement as one of several indicators that the root system or trunk may no longer be holding the tree in a stable position.

The published piece also points to visible trunk damage and root problems. Cracks, splits, hollow sections, and decay can reduce a tree?s strength, while damaged roots or disturbed soil around the base may suggest that the tree has lost support below ground. The article adds that these issues may not stay isolated, since weakness at the base can affect the entire structure above it.

Another part of the guide addresses dead or hanging limbs. Large branches that have died, broken, or remained suspended in the canopy can increase the chance of falling debris during storms or high winds. The article presents branch loss as a warning sign in itself and also as a possible signal that the tree is already under stress.

The resource further describes signs that may appear in the crown and around the base of the tree. Sparse leaves, dead sections in the canopy, fungal growth, exposed roots, and soil movement are all treated as conditions that deserve attention, especially when more than one appears at the same time. By grouping these signs together, the guide gives readers a way to think about patterns of decline rather than a single isolated symptom.

The timing of the publication reflects conditions that many Georgia property owners face during storm season. The company?s website notes that the area has experienced severe thunderstorms and tornadoes in recent years and states that limbs hanging over houses, hidden root rot, and heavy winds can turn nearby trees into a threat to homes and other property. That context gives the newly published warning-sign guide a timely public information angle.

The company site also supports the release by showing that tree removal, trimming, stump grinding, lot clearing, and emergency storm work are part of the business?s stated services. In addition, the website says the company does not top trees and describes topping as dangerous and harmful to the tree, which aligns with the guide?s focus on structural risk and responsible response to visible tree problems. Those details help place the new article within the company?s broader tree care and storm-related work.

The new guide is presented as a current educational update rather than a broad tree encyclopedia entry. It stays focused on one immediate homeowner concern: how to recognize signs that a tree may be close to failure before that failure causes property damage. That narrower focus gives the release a clearer news basis tied to the publication of a specific resource.

Douglas County Tree Service states on its website that it provides tree removal, trimming, dropping, lot clearing, stump grinding, and emergency storm work. The site also says the company serves Douglasville, Lithia Springs, Winston, Villa Rica, and nearby areas, and describes the business as licensed and insured.
