Douglas County Tree Service Publishes Tree Failure Warning Guide

May 28, 2026

May 28, 2026 -
Douglas County Tree Service has published a new educational blog resource titled ?7 Signs a Tree Is About to Fall on Your Property? to help homeowners recognize the early warning signs of unstable and potentially hazardous trees. The article was released as part of the company?s ongoing commitment to educating property owners about tree safety, preventative maintenance, and protecting homes from storm-related damage. The guide outlines several common indicators of tree failure, including sudden leaning, cracked trunks, exposed roots, dead branches, and signs of internal decay, while encouraging homeowners to seek professional assessments before problems become emergencies.

The article explains several visible signs that may indicate a tree is at risk of falling. These signs include large trunk cracks, leaning trees, dead branches, exposed roots, hollow sections, and sudden changes in a tree?s overall condition. The guide also notes that storms and heavy rainfall can increase the risk of tree failure, especially when hidden structural problems are already present.

According to the company, many tree-related accidents happen because early warning signs are overlooked. Trees weakened by disease, decay, or root damage may appear stable until strong winds or saturated soil place additional stress on the structure.

?Trees often show signs of trouble before they fail, but those signs are not always obvious to property owners,? said Alex Laldin, marketing director for Douglas County Tree Service. ?This guide was published to help homeowners recognize common indicators of tree instability and understand when a professional inspection may be needed.?

The resource explains that root damage is one of the most serious issues affecting tree stability. Construction activity, erosion, compacted soil, and excess moisture can weaken root systems over time. In some cases, root damage may not become visible until a tree begins leaning or losing sections of its canopy.

The article also discusses the risks associated with dead or hanging branches. Large dead limbs can break unexpectedly during storms or periods of high wind. The company stated that dead branches may also signal deeper structural problems within the trunk or root system.

Another section of the guide focuses on internal decay. Fungi growing near the base of a tree, hollow cavities, and areas of missing bark may indicate that the tree has lost structural strength. Even when the outside of a tree appears healthy, internal decay can increase the likelihood of failure.

Douglas County Tree Service also noted that sudden movement after storms can point to newly developed hazards. Fresh leaning, cracked soil near the base, or partially uprooted roots may indicate that a tree has become unstable following severe weather conditions.

The release of ?7 Signs a Tree Is About to Fall on Your Property? comes as seasonal storms continue to create tree-related safety concerns across residential areas. Fallen trees and large branches can damage homes, vehicles, fences, and utility lines while also creating hazards for nearby residents.

The company stated that preventive inspections and routine tree maintenance can help identify risks before significant damage occurs. The guide encourages homeowners to monitor trees regularly, especially after periods of heavy rain or strong winds.

Douglas County Tree Service provides tree removal, tree trimming, stump grinding, and related tree care services for residential and commercial properties. The company also publishes educational articles and seasonal safety information through its website and blog.
