

Warner's Outdoor Solutions Shares May Guidance on Paver Patios and Retaining Walls for Twin Cities Properties

May 19, 2026

WOODBURY, MN - May 19, 2026 - PRESSADVANTAGE -

Warner's Outdoor Solutions has reported a notable increase in paver patio and retaining wall projects during May throughout the Twin Cities metro area. As soil conditions stabilize following the spring thaw, the company has experienced elevated demand for these hardscaping installations from both residential and commercial property owners seeking functional outdoor enhancements.

Paver patios establish stable, long-lasting surfaces designed for outdoor seating, dining, and entertainment spaces. These installations typically incorporate concrete, brick, or natural stone pavers placed over carefully compacted base materials with integrated drainage systems. Such construction methods help the structures withstand Minnesota's challenging freeze-thaw cycles and variable weather patterns. Paver retaining walls, constructed using segmental block systems or natural stone, provide essential structural support on sloped properties, assist with erosion control, and facilitate the development of level or terraced areas that improve overall site usability.

The company has completed multiple local hardscaping projects that reflect these applications in real-world

settings. Installations in Maple Grove have included tiered paver retaining walls integrated with patios and fire pits. Projects in Woodbury have combined paver patios with retaining walls or custom pergolas. Natural stone retaining walls have been featured in work completed in Inver Grove Heights and similar communities. These examples highlight adaptations to specific soil types, drainage requirements, elevation changes, and existing landscape conditions commonly encountered across the Twin Cities region.

Industry observations in the Upper Midwest show that May consistently represents a period of heightened activity for hardscaping installations. Moderate temperatures and improved ground stability during this window allow for optimal base compaction and material setting prior to the arrival of summer heat and heavier usage. Warner's Outdoor Solutions became a certified hardscaping installer in 2004 and has applied standardized construction techniques focused on structural integrity and performance in local climate conditions for over two decades.

Ryan Warner, President of Warner's Outdoor Solutions, stated, "May is an ideal time in the Twin Cities for paver patios and retaining walls because the ground has thawed and dried sufficiently for stable, long-lasting installation." He added, "Proper drainage and climate-appropriate material selection remain essential for performance on both residential and commercial properties across the metro area."

Warner's Outdoor Solutions performs comprehensive site assessments for every project. These evaluations include precise measurements, soil analysis, drainage studies, and review of intended functional uses. Paver selections draw from a range of colors, textures, shapes, and laying patterns to coordinate with surrounding architectural and landscape elements. Retaining walls often incorporate additional features such as integrated steps, pillars, seating walls, or lighting components. The installation process follows a structured sequence that prioritizes excavation, base preparation with compacted aggregate layers, edge restraint systems, paver placement, and joint stabilization using appropriate sand or polymeric materials. This methodical approach contributes to durability and helps minimize requirements for ongoing maintenance.

Hardscaping installations of this type integrate effectively with the company's complementary service lines. Newly completed paver patios and retaining walls frequently coordinate with established lawn care programs that include mowing, fertilization, aeration, and overseeding. Irrigation system adjustments and spring start-up services ensure proper water management around hardscaped areas. Additional landscape elements, such as planting beds, lighting, or water features, can be incorporated to create unified outdoor environments capable of functioning through seasonal transitions.

The company maintains its headquarters in Woodbury, Minnesota, at 6625 Bailey Rd. It extends hardscaping, lawn care, and landscaping services to residential and commercial clients across a broad portion of the Twin Cities metro area. This coverage includes Minneapolis, St. Paul, Maple Grove, Plymouth, Lake Elmo, and numerous surrounding communities. Professional crews manage all phases of each project,

from initial design consultation through final installation, while observing applicable local codes, permitting requirements, and environmental standards.

Warner's Outdoor Solutions has delivered lawn care, landscaping, and hardscaping design and build services for more than 25 years in the Twin Cities region. The company continues to respond to property owner requirements for durable, functional outdoor improvements as seasonal conditions and market demand evolve.
