

Town Oil Addresses Growing Demand for Ductless Mini-Split Repair Services

May 20, 2026

WETHERSFIELD, CT - May 20, 2026 - PRESSADVANTAGE -

Town Oil has expanded its focus on ductless mini-split repair services as homeowners across the East and West Hartford areas prepare for increased cooling demands heading into the summer season. The move comes as ductless systems continue to gain popularity in older homes, additions, and properties where installing traditional ductwork may not be practical.

Town Oil operates as ductless mini-split repair experts in the region, with work centered on the types of systems commonly found in homes without existing duct infrastructure.

Ductless mini-split systems have become more common in historic homes and structures where installing full duct systems may be impractical due to architectural constraints. These systems provide an alternative method for temperature control, but their design and installation characteristics can present distinct maintenance and repair considerations compared to conventional HVAC systems.

Town Oil, which serves homeowners throughout the East and West Hartford areas, has tailored its repair services to address the maintenance and performance challenges commonly associated with ductless

mini-split systems. The company's work includes diagnosing issues related to seasonal wear, aging equipment, and system layouts frequently found in older residential properties.

Carin Oppelt of Town Oil said the growing number of ductless mini-split installations throughout the East and West Hartford areas has led to increased demand for repair services tailored to these systems. Oppelt noted that many homes in the region were not originally designed with central ductwork, requiring service technicians to address installation and performance issues specific to ductless configurations.

The growing use of ductless mini-split systems in older homes reflects a broader trend toward adaptable climate control solutions that work within existing property layouts. For many homeowners, ductless systems provide an alternative to extensive renovations associated with installing central air. As these systems see heavier use during warmer months, maintaining consistent performance can depend on timely repairs and service that account for the demands placed on high-use residential cooling equipment.

In the East and West Hartford areas, seasonal temperature increases in June typically correspond with a rise in system usage. During this time, systems may experience issues related to airflow, refrigerant levels, or electrical components. The nature of ductless systems, which rely on individual indoor units connected to an outdoor condenser, can require a different diagnostic process compared to centralized systems. Homeowners in the region have increasingly sought service providers familiar with the operational demands and repair requirements associated with multi-zone ductless cooling systems during periods of sustained seasonal heat.

Town Oil's service offering reflects these distinctions, focusing on repair scenarios that are commonly observed in non-ducted environments. This includes evaluating system performance across multiple indoor units, as well as identifying inconsistencies that may not be immediately apparent in single-zone configurations.

The company's work in this area aligns with the characteristics of housing stock in the East and West Hartford areas, where a mix of historic and mid-century homes continues to shape how heating and cooling systems are implemented. In such settings, ductless systems are often installed incrementally, sometimes resulting in configurations that differ from newer, standardized installations.

As the summer season progresses, ductless systems are expected to remain a key component of residential cooling strategies in the region. The continued use of these systems in older homes underscores the importance of repair services that account for both system design and the structural context in which they operate.
