

Utah Trenchless Highlights Advanced Methods for Minimizing Property Disruption During Sewer and Water Line Replacement

May 21, 2026

SALT LAKE CITY, UT - May 21, 2026 -
Utah Trenchless, a locally owned plumbing company specializing in advanced underground infrastructure solutions, is bringing attention to its trenchless sewer and water line replacement methods for properties where minimizing excavation, landscaping disruption, and surface damage is especially important.

The company's trenchless technology offers property owners an alternative to traditional excavation methods that can destroy driveways, sidewalks, mature landscaping, and other surface features. By utilizing specialized equipment and techniques such as pipe bursting and pipe lining, the company can repair or replace damaged underground infrastructure through minimal access points, preserving the integrity of the property above.

"Property owners often delay necessary sewer and water line repairs because they dread the destruction that comes with traditional excavation," said Spencer Ruff, co-owner of Utah Trenchless. "Our trenchless methods

can complete the same repairs with just two small access points instead of digging up an entire yard. This approach saves our customers thousands of dollars in restoration costs while getting their systems back to full functionality faster."

The trenchless approach has become increasingly relevant as many properties in the region face aging infrastructure challenges. Pipes installed decades ago are reaching the end of their service life, leading to frequent backups, leaks, and other issues that require professional intervention. Traditional repair methods typically involve excavating long trenches to access the damaged pipes, a process that can take days or weeks and leave properties in disarray.

Utah Trenchless in Salt Lake City employs several advanced techniques to address these challenges. Pipe bursting involves pulling a new pipe through the existing damaged pipe while simultaneously fracturing the old pipe outward. Pipe lining creates a new pipe within the existing pipe using epoxy resin that cures in place, effectively sealing cracks and restoring structural integrity. Both methods require minimal excavation and can often be completed in a single day.

The company also emphasizes the importance of proper diagnosis before beginning any repair work. Using high-definition video inspection equipment, technicians can identify the exact location and nature of underground problems, ensuring that the most appropriate and cost-effective solution is implemented.

"Every property and every situation is unique, which is why we always start with a thorough inspection," added Ruff. "Sometimes a simple repair is sufficient, while other cases require full replacement. Our video inspection technology allows us to show property owners exactly what's happening underground so they can make informed decisions about their repairs."

Beyond residential properties, the trenchless approach proves particularly valuable for commercial properties, historic buildings, and locations where traditional excavation would cause significant business disruption or damage irreplaceable features.

Utah Trenchless is a Salt Lake City-based company owned by Spencer and Kourtney Ruff. The company provides a comprehensive range of underground infrastructure services including trenchless sewer repair, sewer line inspection, drain cleaning, water main repair, utility locating, and emergency services. The company serves properties throughout Salt Lake City and surrounding counties, offering financing options for larger repair projects.
