

Algo Trading Space Releases Major Update to Prop Firm Robots App

June 04, 2026

ELIN PELIN, BG - June 04, 2026 -
Algo Trading Space has released a significant update to its Prop Firm Robots App, expanding the platform's trading capabilities across currency pairs, timeframes, and configuration options for traders building automated portfolios for proprietary trading firm challenges.

The update introduces several new features across the app, including broader currency pair coverage, three additional timeframes, a redesigned challenge configuration interface, a new strategy filtering menu, and a new Specifications tab for customising exported expert advisors before deployment.

"This update reflects how traders are actually using the app," said a spokesperson for Algo Trading Space. "They need more symbols, more timeframes, and more control over how they configure and export their EAs. Every feature in this release addresses a real gap in what the platform could previously offer."

The currency pair expansion increases the number of available trading opportunities within the app, allowing traders to build portfolios with lower correlation between strategies and broader exposure to different market conditions. The addition of multiple new pairs also increases the variety of expert advisor behaviours

accessible from a single platform, giving traders more options when constructing and balancing a prop firm portfolio.

On the timeframe side, the app now supports M15, M30, and H1 in addition to its existing options. These additions increase the total number of expert advisor combinations available within the platform. Traders who prefer lower-frequency systems with smoother equity curves can now combine those with faster-execution strategies within the same portfolio, without needing to source tools from separate platforms.

The redesigned Challenge Options interface represents one of the more substantial usability changes in the update. Previously, challenge configurations were handled through predefined dropdown selections. The new interface consolidates all configuration controls into a single unified menu, where traders can manually set account size, risk per trade, maximum loss, maximum daily loss, and profit target. This gives traders the flexibility to tailor expert advisor settings precisely to the requirements of different proprietary trading firms and account types.

A new Winners and Latest menu has been added to the platform interface, giving traders a dedicated area to identify the most profitable expert advisors, discover recently added strategies, and filter for systems with longer operational histories. The menu is intended to reduce the time traders spend searching for suitable strategies and to surface both newer additions and established performers in one place.

The Specifications tab is a new addition that addresses a practical need for traders working across multiple brokers or prop firms. Before exporting an expert advisor from the platform, traders can now customise its specifications to match the symbol naming conventions and account settings of their intended trading environment. This is particularly relevant for prop firms and brokers that use non-standard symbol identifiers.

"The direction of the app is towards becoming a complete environment for systematic prop firm trading," the spokesperson said. "More symbols, more timeframes, better filtering, and better export control all contribute to that. This update moves the platform significantly closer to that goal."

The Prop Firm Robots App is accessible through the Algo Trading Space platform and is designed for traders participating in proprietary trading firm evaluation programmes, providing tools to construct, configure, and export diversified expert advisor portfolios.

About Algo Trading Space

Algo Trading Space is a platform dedicated to algorithmic trading education, expert advisor reviews, and automated strategy analysis. It provides traders with independent content covering backtesting, broker selection, and the evaluation of trading tools across forex, indices, and other asset classes. The platform

publishes in-depth reviews of expert advisors based on verified performance data, serving a global community of traders who approach the markets through systematic, rules-based methods.
