

Homeward Environmental Expands French Drain Specialists Division with Advanced Groundwater Technology

June 12, 2026

June 12, 2026 -
Homeward Environmental has announced the expansion of its outdoor drainage department with new team positions and the introduction of advanced groundwater pump technology that enhances the performance of French drain systems throughout Indiana.

The environmental services company has opened multiple full-time positions within its growing drainage division as demand for comprehensive water management solutions continues to rise across the state. The expansion comes as Homeward Environmental introduces proprietary sealed pump systems that address common challenges in outdoor drainage applications.

"Our new groundwater pump technology represents a significant advancement in how we approach drainage solutions," said Todd Bell, who runs inspections and sales at Homeward Environmental. "By combining these sealed, debris-filtering pumps with our French drain installations, we're providing Indiana property owners with a level of protection and reliability that hasn't been available until now."

The company's enhanced pump systems feature sealed components and advanced filtration mechanisms that prevent debris accumulation, addressing the primary cause of failure in traditional outdoor pump installations. As French Drain Specialists, Homeward Environmental has developed this technology specifically to complement their drainage systems, creating an integrated solution that manages both surface water and groundwater more effectively than conventional methods.

The expansion also includes the addition of residential retention pond installation to the company's service offerings. These engineered ponds provide dual benefits for property owners by creating water storage capacity for future irrigation needs while simultaneously controlling erosion on residential properties.

"The combination of retention ponds with our existing drainage solutions allows us to offer complete water management systems," added Bell. "Property owners can now capture and utilize rainwater rather than simply directing it away from their structures, which provides both environmental and economic benefits."

The growth in Homeward Environmental's drainage department reflects increasing awareness among Indiana property owners about the importance of proper water management. With changing weather patterns producing more intense rainfall events, the demand for professional drainage solutions has accelerated significantly over the past several years.

Homeward Environmental's comprehensive approach to water management extends beyond French drains to include buried downspouts, yard drainage systems, retaining walls, gutters, and gutter guards. Each service is designed to work in concert with others, creating integrated systems that protect properties from water damage while preserving landscape aesthetics.

The company maintains strict adherence to industry standards and local regulations in all installations, ensuring that drainage solutions meet or exceed code requirements while effectively mitigating environmental hazards.

Homeward Environmental LLC specializes in environmental services that protect residential and commercial properties from water damage. The company provides customized drainage solutions, retaining wall construction, and gutter systems designed to manage water flow and prevent foundation damage. With a focus on innovation and customer satisfaction, Homeward Environmental serves property owners throughout Indiana with personalized solutions tailored to each property's unique challenges.
