RichArt Graphics Traces the Evolution of Banner Printing

June 12, 2026

PHILADELPHIA, PA - June 12, 2026 -

Visual communication remains a central component of how organizations, venues, and institutions convey information to the public. Since the mid-twentieth century, the methods used to produce large displays have shifted entirely from manual craftsmanship to advanced digital processes. Operating through decades of these industry shifts, RichArt Graphics has produced large size displays and visual materials since 1945. In the early days, the company relied entirely on artists to hand-paint signs, posters, and displays for local venues like the Fox, Mastbaum, Arcadia, and Stanton theaters. Black and white photographs were meticulously colored by hand to create vibrant promotional materials for burlesque houses, political events, and area businesses. Today, those manual techniques have been replaced by advanced digital equipment, but the foundational understanding of visual composition remains. Organizations still require high-visibility materials to capture attention, maintaining a steady demand for banner printing in Philadelphia, PA. The transition from paintbrushes to digital printheads represents a natural progression in the ongoing effort to create striking imagery.

Current direct to board flatbed print technology allows images to be produced straight onto rigid materials. This modern method bypasses older requirements for mounting or laminating prints to separate boards.

Digital files are translated into durable visuals on substrates up to nearly two inches thick and up to ninety-eight inches wide. Production facilities handle materials ranging from standard plastics, foamboard, and acrylic to specialized surfaces like wood, metal, and glass. Roll-to-roll materials including wallpaper, fabric, and adhesive vinyl are processed alongside these rigid boards. When organizations seek solutions for banner printing in Philadelphia, PA, they often require materials that can withstand outdoor elements while retaining the visual clarity expected in an indoor museum setting. Flatbed printing achieves this balance by utilizing durable screen printing inks that cure quickly and resist fading. The capacity to print single or double-sided graphics with no minimum order quantity provides flexibility for projects ranging from single event signs to extensive retail point-of-purchase displays.

Staffing production facilities with individuals who possess fine art backgrounds introduces an exacting standard to the manufacturing process. Rather than simply operating machinery, trained artists oversee color matching, image resolution, and material selection. This trained eye ensures that files supplied by clients translate accurately into the final physical product. Attention to technical details prevents common issues like pixelation or color shifting across different substrates. The production of fine art reproductions, custom art murals, and specialized museum exhibits demands precise execution. Employees approach large format graphics not just as manufactured goods but as visual installations. This artistic perspective influences every stage of the process, from file preparation to final output.

The physical creation of a graphic represents only one phase of visual display production. Proper finishing and structural support are necessary to prepare large format prints for installation. Production facilities integrate various finishing services directly into the manufacturing workflow. Computerized contour cutting shapes rigid materials into specific designs, while specialized sewing and grommeting reinforce flexible materials like vinyl and fabric. Additional services include mounting, computerized routing, full carpentry fabrication, and the creation of freestanding display structures. For materials destined for distant locations or demanding gallery spaces, custom crating and fulfillment packing ensure safe transit. Providing these specialized finishing services under one roof eliminates the need to transport materials between multiple vendors, reducing the risk of damage and keeping projects strictly aligned with delivery schedules.

RichArt Graphics is a commercial printing and graphic design company operating in the visual communications sector. The business produces large format displays, custom wallpaper, museum exhibits, fleet graphics, and trade show materials. Operating out of Pennsylvania, the company combines an artistic background with modern digital production methods to deliver visual solutions for businesses and local institutions. Providing options ranging from vehicle wraps to professional banner printing in Philadelphia, PA, the facility handles projects from initial file preparation through custom fabrication and final packing.
