

Culligan of Red Wing Offers Free In-Home Water Testing to Help Identify Local Water Quality Concerns

June 18, 2026

RED WING, MN - June 18, 2026 - PRESSADVANTAGE -

Culligan of Red Wing encourages residents in southeastern Minnesota and western Wisconsin to take advantage of free in-home water testing as part of efforts to better understand local water conditions. The company, which has provided water treatment expertise in the area since 1936, conducts in-home assessments to detect common issues without cost or obligation to participants.

Water quality can vary across communities due to factors such as municipal treatment methods, private well sources, and regional geology. In the Red Wing area, many households encounter elevated mineral content or other variables that affect daily use. Professional testing provides data on parameters such as hardness, pH levels, and potential contaminants, allowing for informed decisions about water management.

The free in-home water test follows a straightforward process. Residents schedule an appointment online or by phone, after which a trained technician visits the home to collect samples and perform initial analysis. Results are reviewed on site, with explanations of the findings provided in a detailed report. For more complex concerns, such as those involving private wells or specific contaminants, the company coordinates advanced testing through an EPA-certified laboratory.

Common triggers for testing include recent moves into a new home, reliance on private well water, noticeable changes in taste or odor, visible scale buildup on fixtures, or recurring health symptoms potentially linked to water. The EPA recommends annual testing for private wells to check for bacteria, nitrates, arsenic, and other substances. Culligan of Red Wing extends testing capabilities to address a range of issues, including lead, E. coli, nitrates, arsenic, and additional contaminants such as copper, radon, and PFAS compounds.

Local customer experiences shared on independent platforms reflect the role of these tests in the community. Reviewers have described technicians who conducted thorough assessments, explained results clearly, and helped identify next steps without pressure. One account highlighted how testing led to a better understanding of household water dynamics, while others noted the educational value of the on-site process.

This service aligns with broader industry practices promoted by organizations focused on water quality. Professional testing helps distinguish between aesthetic concerns and potential health-related issues, supporting proactive steps in residential water management. Culligan of Red Wing operates within a national network of more than 600 locations, adapting standardized testing protocols to the specific profiles found in the Upper Mississippi River Valley region.

"Free in-home water testing gives local residents accurate information about their home's water supply based on current conditions," said Justin Bohl, the owner of Culligan of Red Wing. "It serves as a starting point for addressing any identified concerns through appropriate measures."

Bohl added, "Our team focuses on clear communication during our tests and helping homeowners interpret the results in the context of local water sources and usage patterns."

Culligan of Red Wing serves Red Wing and surrounding communities including Lake City, Prescott, Cannon Falls, Zumbrota, Wabasha, Goodhue, Pepin, Ellsworth, Pepin County, and Pierce County. The company draws on decades of experience to support residential water quality evaluation in the area.

With operations dating to 1936, Culligan of Red Wing continues to apply local knowledge of regional water characteristics to assist residents through services such as water testing. Their expertise helps ensure that families have access to safe drinking water, fostering a better understanding of the importance of water quality for health and daily living.
