

SoftPro Water Systems Highlights Advanced Iron Filtration Technology for Well Water Contamination

July 09, 2026

Box Elder, South Dakota - July 09, 2026 -
SoftPro Water Systems, a leading provider of water treatment solutions, is addressing the widespread challenge of iron contamination in private well water through its Iron Master AIO system, which utilizes chemical-free Air Injection Oxidation technology to remove iron, manganese, and hydrogen sulfide from residential water supplies.

The Iron Master AIO system represents a comprehensive approach to treating well water contamination that affects millions of American households. The system employs Air Injection Oxidation technology to oxidize and filter contaminants without requiring chemical additives, addressing common water quality issues including rust stains on fixtures, metallic taste in drinking water, and sulfur-related odors.

"Well water contamination remains a significant concern for homeowners across the country, with iron being one of the most prevalent issues we encounter," said a spokesperson for SoftPro Water Systems. "The Iron Master AIO system provides an effective, maintenance-friendly solution that eliminates up to 30 parts per

million of iron while preserving the natural flow rate that homeowners expect."

The Iron Filter for Well Water operates through a multi-stage process that begins with air injection to oxidize dissolved contaminants, followed by filtration through specialized media. This approach eliminates iron, manganese, and hydrogen sulfide without the ongoing expense and environmental concerns associated with chemical treatment methods. The system's automatic backwashing feature ensures consistent performance while minimizing maintenance requirements.

Iron contamination affects approximately 40 percent of private wells in the United States, according to geological surveys. Beyond aesthetic concerns such as orange staining and unpleasant taste, elevated iron levels can damage plumbing systems, water heaters, and household appliances over time. The presence of manganese and hydrogen sulfide compounds these challenges, creating additional taste, odor, and staining issues that impact daily water use.

The Iron Master AIO system addresses these multiple contaminants simultaneously through its integrated design. The air injection process converts dissolved iron into solid particles that can be effectively filtered, while also oxidizing manganese and neutralizing hydrogen sulfide gases responsible for rotten egg odors. This comprehensive treatment approach ensures that treated water meets quality standards for household use.

Automatic backwashing functionality distinguishes the system from traditional iron removal methods that require frequent manual maintenance. The self-cleaning cycle flushes accumulated contaminants from the filtration media on a predetermined schedule, maintaining optimal performance without homeowner intervention. This automation reduces the time and effort typically associated with well water treatment systems.

The system's capacity to handle iron concentrations up to 30 parts per million exceeds the treatment range of many conventional filtration methods. This robust performance capability makes it suitable for wells with varying contamination levels, from mild iron presence to more severe cases that would overwhelm standard filters.

SoftPro Water Systems has established itself as a provider of water treatment solutions for both residential and commercial applications. The company offers a comprehensive range of products including water softeners, whole house filtration systems, and specialized treatment equipment for specific contaminants. With over 100,000 customers nationwide, the company maintains a focus on factory-direct distribution and technical support for water quality improvement.
