

SoftPro Water Systems Highlights Advanced Fluoride Filter Technology for Enhanced Home Water Treatment

July 13, 2026

Box Elder, South Dakota - July 13, 2026 -
SoftPro Water Systems, a leading provider of residential and commercial water treatment solutions, is addressing growing concerns about water quality by highlighting the advanced capabilities of its Whole House Chlorine Plus & Fluoride SUPER Filter system. The system represents a significant advancement in home water treatment technology, combining catalytic carbon with bone char media to reduce fluoride and other modern contaminants beyond what standard carbon filtration can achieve.

The fluoride water filter system addresses a critical need for families seeking comprehensive water treatment solutions that go beyond basic municipal water processing. By integrating dual-media technology, the system targets both chlorine and fluoride, along with other contaminants that may remain in city water supplies after standard treatment processes.

"Families today are increasingly aware that municipal water treatment, while meeting basic safety standards, may not address all their concerns about water quality," said a spokesperson for SoftPro Water Systems.

"Our advanced filtration technology provides an additional layer of protection, ensuring that the water used for drinking, cooking, and daily household activities meets the highest standards of purity and safety."

The system utilizes a unique combination of catalytic carbon and bone char media, materials specifically selected for their ability to reduce fluoride levels while simultaneously addressing chlorine, chloramines, and other common water contaminants. This dual-action approach ensures comprehensive treatment throughout the entire home, protecting both plumbing infrastructure and family health.

Unlike point-of-use filters that only treat water at individual taps, the whole house system provides filtered water at every outlet in the home. This comprehensive approach means that water used for bathing, laundry, and other household purposes receives the same level of treatment as drinking water, providing consistent quality throughout the residence.

The technology behind the system reflects advances in water treatment science, particularly in addressing fluoride reduction. While fluoride is commonly added to municipal water supplies, many families prefer to control their fluoride exposure, particularly for young children and individuals with specific health considerations. The bone char media component specifically targets fluoride molecules, providing effective reduction without compromising the system's ability to address other contaminants.

Installation and maintenance considerations have been streamlined to ensure accessibility for homeowners. The system is designed to integrate with existing plumbing infrastructure, and replacement filters are readily available to maintain optimal performance over time. More information about the complete range of water treatment solutions can be found at https://www.softprowatersystems.com/.

SoftPro Water Systems has established itself as a trusted provider of water treatment solutions, offering a comprehensive range of products including water softeners for city and well water, iron filters, and commercial systems. The company serves over 100,000 customers nationwide and maintains certifications from leading industry organizations including IAPMO, WQA, NSF, and ISO 9001. With a focus on factory-direct distribution, lifetime warranties, and customer satisfaction guarantees, SoftPro continues to advance residential water treatment technology to meet evolving consumer needs and water quality challenges.
