

Envisia Lifestyle Dentistry Announces Expanded Digital Treatment Planning for Orthodontic and Restorative Procedures

July 13, 2026

Bellingham, Washington - July 13, 2026 -

Envisia Lifestyle Dentistry has implemented advanced digital scanning technology to enhance treatment planning for orthodontic and restorative dental procedures at its Bellingham practice. The technology update enables more precise treatment mapping for clear aligner therapy, dental implants, and cosmetic restorations.

The dental practice, which has served the Bellingham community for over four decades under Dr. Robert Knudson's leadership, introduced the digital planning system to address increasing patient demand for predictable treatment outcomes. The technology creates three-dimensional models of patients' teeth and jaw structures, allowing for detailed treatment visualization before procedures begin.

The digital system supports multiple treatment modalities at the practice. For orthodontic cases, Invisalign in Bellingham treatments now begin with digital impressions that eliminate traditional molding materials. The scans generate treatment simulations showing projected tooth movement over time, with aligners manufactured based on these precise measurements.

"Digital treatment planning represents a significant advancement in how we approach comprehensive dental care," said Dr. Robert Knudson, lead dentist at Envisia Lifestyle Dentistry. "The technology allows us to map out entire treatment sequences with greater precision, from initial consultation through final restoration."

Patients requiring tooth replacement benefit from the technology through enhanced implant placement planning. Dental implants in Bellingham procedures utilize the digital scans to determine optimal positioning within the jawbone, accounting for bone density and adjacent tooth structures. According to industry data from the American Academy of Implant Dentistry, properly planned implant procedures demonstrate success rates of 95 percent over a 10-year period.

Recent dental industry reports indicate growing adoption of digital treatment planning technologies across practices nationwide. The American Dental Association notes that approximately 35 percent of dental practices now utilize some form of digital scanning technology, representing a 15 percent increase over the past three years.

"The integration of digital planning tools reflects broader changes in dental practice standards," added Dr. Knudson. "These technologies support more predictable treatment pathways while reducing the number of appointments required for many procedures."

The practice also employs digital planning for cosmetic restorations. Porcelain veneers in Bellingham treatments incorporate digital smile design protocols, enabling patients to visualize potential outcomes through computer-generated previews. The technology measures tooth proportions and facial symmetry to guide veneer fabrication.

The practice accommodates Russian and Ukrainian-speaking patients, with multilingual staff available to explain digital treatment plans in patients' preferred languages. This capability ensures clear communication throughout the planning and treatment phases.

Implementation of the digital system required staff training on new protocols and workflows. The practice completed certification programs for the technology over a six-month period, ensuring all team members could effectively utilize the planning tools.

Envisia Lifestyle Dentistry provides comprehensive dental services including preventive care, restorative procedures, and orthodontic treatments. The practice operates Monday through Thursday at its Squalicum Parkway location in Bellingham, Washington.
