

Credence Chiropractic Details Impact of Pediatric Adjustments on Nervous System Function

July 17, 2026

GEORGETOWN, TX - July 17, 2026 -

Credence Chiropractic has published a new newsletter resource explaining its approach to pediatric chiropractic care and the role of nervous system-focused wellness for children and families. The Georgetown, Texas practice, which opened in 2017, provides pediatric, prenatal, and whole-family chiropractic services with a focus on individualized care plans and evidence-informed techniques.

The resource explains how Credence Chiropractic incorporates neurological principles into its pediatric services. The practice focuses on supporting communication between the brain and body through assessments, chiropractic adjustments, and patient education designed for families exploring wellness-focused care options.

"Parents want to understand how their children's health and development are supported," said Dr. Chris Hill, co-founder and chiropractor at Credence Chiropractic. "Our goal is to provide families with education, thorough assessments, and care options that support their wellness goals."

Children experience many stages of physical development, and Credence Chiropractic emphasizes the importance of understanding each child's unique needs. The practice uses consultations, health history reviews, and technology-supported assessments to help guide recommendations for pediatric patients.

Credence Chiropractic uses the Torque Release Technique as part of its pediatric chiropractic approach. The technique uses a handheld instrument to deliver targeted adjustments without manual twisting or forceful movements. The practice describes this method as one of the techniques used within its approach to pediatric care.

"Every child is different, and we believe care should begin with understanding each family's needs," said Dr. Chris Hill. "Our assessment process helps us create recommendations based on each patient's individual circumstances and wellness goals."

The practice also incorporates assessment technology through Insight Millennium Technology. These tools provide information related to areas such as autonomic function, muscle activity, and thermal patterns. Technologies including heart rate variability, surface electromyography, and thermography are used as part of the practice's evaluation process.

Research in chiropractic care and neurological function has explored topics including autonomic responses, musculoskeletal health, and changes in nervous system activity. Peer-reviewed studies have examined chiropractic adjustments and their relationship to neurological measurements, including research published in journals such as *Neural Plasticity* and the *Journal of Manipulative & Physiological Therapeutics*. Credence Chiropractic references this research as part of its educational approach when discussing nervous system health and chiropractic care.

The practice distinguishes between research findings and individual experiences shared by patients and families. Information provided through Credence Chiropractic's resources reflects the practice's approach, clinical observations, and patient education efforts rather than a guarantee of specific health outcomes.

Dr. Chris Hill and Kate Hill, co-founders of Credence Chiropractic, bring specialized backgrounds to the practice's family-focused services. Dr. Chris Hill graduated from Logan University and has completed additional training related to pregnancy and pediatric chiropractic care. Kate Hill is a certified doula who focuses on supporting families through pregnancy, postpartum, and early childhood wellness.

"Family wellness is about providing support during every stage of life," said Kate Hill, co-founder and certified doula at Credence Chiropractic. "My background in doula care helps me connect with families during important transitions and understand the resources parents may need."

The new patient process at Credence Chiropractic includes a consultation, neurological assessment, and review of findings before developing a care plan. The practice uses this process to create recommendations based on each patient's individual needs and wellness goals.

Credence Chiropractic provides care for children, expecting mothers, and families throughout Georgetown and surrounding communities. Services include pediatric chiropractic care, prenatal chiropractic care, whole-family chiropractic care, and neurological chiropractic care.

By combining chiropractic techniques, technology-supported evaluations, and patient education, Credence Chiropractic continues to provide families with information about pediatric wellness and its approach to family care. The practice remains focused on helping families understand available chiropractic options and supporting informed decisions about their wellness goals.
