

Bruce Andrews Seamless Gutters and Roofing Highlights Benefits of Regular Gutter Maintenance and LeafLock Protection

July 17, 2026

BAY CITY, WI - July 17, 2026 -

Bruce Andrews Seamless Gutters and Roofing is reminding property owners in Minnesota and western Wisconsin of the role regular gutter maintenance plays in protecting homes and buildings from water-related issues. As summer progresses with increased rainfall and falling leaves from mature trees common in the region, clogged gutters can lead to overflows that direct water toward foundations, potentially causing erosion, basement leaks, and damage to landscaping.

Clogged gutters allow water to spill over edges or back up under roof edges, which can accelerate wear on fascia boards, soffits, and shingles. In the Upper Midwest climate, where freeze-thaw cycles follow heavy rains, these problems can worsen quickly. Proper cleaning removes debris such as leaves, twigs, and seeds that accumulate and restrict water flow to downspouts.

The company recommends periodic inspections and cleaning to maintain system performance. This practice helps ensure that rainwater is channeled away from the structure effectively, reducing strain on the roof and exterior elements over time. For many properties, especially those with heavy tree cover near the Twin Cities

area or along the St. Croix River valley, maintenance becomes particularly relevant during seasonal transitions.

Bruce Andrews, owner, stated, "Regular gutter maintenance is a straightforward step that supports the long-term integrity of a property's exterior systems. It addresses common issues before they develop into more significant repair needs."

To reduce the frequency of cleaning, the company serves as an authorized dealer for the LeafLock Gutter Protection System. This system features a patented hanger and bracket design that helps keep gutters clear of leaves and debris while allowing water to enter freely. Installed as part of new seamless gutter systems or as a retrofit, LeafLock complements custom seamless gutters fabricated onsite to fit specific rooflines.

Seamless gutter systems from the company are designed without joints that can separate over time, providing a continuous channel for water. When combined with protection like LeafLock, the setup helps minimize blockages that contribute to overflows. This approach aligns with broader efforts to manage water runoff in areas prone to variable precipitation.

In addition to gutter services, the company handles related exterior work that can be affected by poor drainage. This includes soffit and fascia repairs, siding maintenance, and roofing elements such as asphalt shingles or metal panels. Assessments often reveal how unresolved gutter issues can impact these adjacent components.

The firm, based in Bay City, Wisconsin, draws on experience with local conditions to advise on maintenance schedules tailored to individual properties. Factors such as surrounding vegetation, roof pitch, and exposure to prevailing winds influence how quickly debris accumulates and how often intervention may be needed.

Andrews added, "Many property owners find that addressing maintenance proactively, including consideration of systems like LeafLock, helps avoid emergency situations during heavy rain periods common in Minnesota and Wisconsin."

Founded in 2000 by Bruce Andrews as a one-man operation in a home shop, the business relocated to Bay City, Wisconsin, in 2015 after a fire. It has since expanded to serve residential and commercial clients across the greater Twin Cities region in Minnesota and Western Wisconsin. Projects include single-family homes, multi-unit dwellings, HOA properties, and commercial buildings for property managers, contractors, and developers.

The company operates under principles of faith, integrity, quality, respect, and pride in workmanship. Its services encompass full evaluations to identify potential problem areas in gutter systems before issues

escalate. This includes checking for proper slope, secure attachments, and downspout capacity in relation to roof size.

During maintenance visits, technicians can also assess for secondary concerns such as ice dam vulnerabilities in winter or hail impact from past storms. Such comprehensive reviews support informed decisions on whether cleaning alone suffices or if upgrades would provide additional benefits for water management.

As vegetation reaches peak growth in mid-summer, the volume of organic debris entering gutters tends to increase. Timely action helps sustain drainage efficiency through the remainder of the season and into fall, when leaf drop intensifies. Property owners in both urban and rural settings across the service area can benefit from evaluating their current systems.

Bruce Andrews Seamless Gutters and Roofing continues to support clients with practical solutions for exterior protection. The combination of routine maintenance and compatible protection systems like LeafLock contributes to managing water effectively in challenging regional weather patterns. This focus helps preserve property conditions without relying solely on reactive repairs.
