

More Secure Locksmiths Expands Service Offerings to Include Digital Locks and Keyless Entry Systems

July 28, 2026

July 28, 2026 -

More Secure Locksmiths has formally announced an expansion of its core service portfolio, introducing advanced digital lock installations, keyless entry integration and specialised security consultation services for residential and commercial clients.

The service expansion follows an internal operational review and market analysis assessing local adoption rates of smart home hardware and integrated access control systems. As residential and commercial properties increasingly transition from mechanical hardware to electronic access management, the company has updated its technical scope to service modern electronic locking mechanisms alongside traditional locksmithing services. When clients are wondering if there are experienced locksmiths near me, they have a solid answer.

The updated service line includes the supply, installation and maintenance of several new hardware categories:

Digital & electronic locks: Retrofitting and new installations of keypad, biometric and proximity-card locking mechanisms.

Keyless entry systems: Integration of smart deadbolts and access systems manageable via mobile applications and localised networks.

Commercial security audits: Structured consultations designed to evaluate existing physical security barriers and identify vulnerabilities in access points.

Recent Australian building and property management data reflects a steady shift towards integrated electronic access, driven by demands for remote access control, temporary credential management for trades or short-term rentals and real-time audit logs. The incorporation of these digital systems allows More Secure Locksmiths to address hardware modernisations across both existing structures and new property

builds.

'As property management technology becomes more integrated, the requirements for physical locking mechanisms are shifting,' says a source from More Secure Locksmiths. 'The introduction of digital access platforms allows us to provide hardware options that accommodate remote key management and electronic access tracking alongside traditional mechanical keying.'

All newly introduced electronic access products and installation procedures adhere directly to relevant Australian Standards, including AS 4145 for locksets and hardware, as well as local National Construction Code (NCC) egress requirements. More Secure Locksmiths ensures that all digital installations on fire-rated doors and emergency exit paths maintain complete structural and safety compliance.

By prioritising hardware that meets national safety benchmarks, the expanded service catalogue ensures that commercial site managers and residential owners remain fully compliant with building codes and insurance policy prerequisites when upgrading their physical security infrastructure.

Alongside the service expansion, More Secure Locksmiths has launched an online information portal hosted on the company's official website. The platform features technical guides and factual articles detailing current physical security standards, the operational differences between various electronic locking technologies and maintenance procedures for digital access hardware.

The educational series covers technical topics such as:

Power redundancy and emergency override protocols for electronic locks during mains power outages. Ingress protection (IP) ratings for outdoor digital hardware exposed to varied weather conditions. Comparative security analysis between standard mechanical cylinders and digital deadbolts. Compliance considerations for commercial fire doors and emergency exit hardware when retrofitting electronic locks.

This resource aims to assist property owners and facility managers in evaluating their security requirements prior to hardware upgrades, providing objective technical data regarding compatibility and installation requirements.

The new services are fully integrated into More Secure Locksmiths' standard daily operations across their designated service areas. Technical staff have completed specialised training regarding electronic component wiring, software configuration and non-destructive entry methods specific to modern electronic locks.

With these operational updates now active, More Secure Locksmiths will continue to offer standard

emergency lockout assistance, re-keying and mechanical repair services while supplying and servicing electronic access management hardware for clients searching for reliable locksmiths near me.

For detailed technical specifications, service area breakdowns or media enquiries regarding the expanded hardware offerings, please visit the More Secure Locksmiths official website or contact their operations desk directly.
